

7. Appendix

7.1 Ergebnislisten

Die Proben wurden fortlaufend mit einer Laborbuchnummer versehen. Unter dieser Nummer wurde jede Probe im Routineansatz mit den Paneln W1, W2, W3 (=shig ipaH) und C3 (=pCVD) getestet. Zeigten sich in der Multiplex- PCR Banden, wurden die entsprechenden Primer des jeweiligen Einzelansatzes einzeln, d.h. im Monoplex- Ansatz, getestet. War die Testung der Probe abgeschlossen, bekam die Probe ein Sternchen (*). Rektalabstriche von Säuglingen wurden parallel auf Endo ausgestrichen und in einer gesonderten Spalte mit Sele für Selenitboullion gekennzeichnet. Banden in den 4 Routine- Panel wurden mit + bzw. der Bandenlänge in der entsprechenden Spalte des Panels gekennzeichnet. Das Ergebnis der anschließenden Einzeltestung der Primer wurde in der Spalte des jeweiligen Primers vermerkt. Spezifische Banden wurden als beweisend für den Pathovar angesehen und das Ergebnis vermerkt. Traten unspezifische Banden auf, wurde dies unter ‚Ergebnisse‘ mit unsp. vermerkt. Banden von 310 bp Länge in W2 und SLT 1 wurden zusätzlich gekennzeichnet mit Verdacht auf *Salmonella* ssp. Traten bis auf die Positivkontrolle keine Banden auf, wurde unter Ergebnisse ‚%VF‘ für ‚keine Virulenzfaktoren‘ vermerkt. Das Ergebnis hatte Gültigkeit, sofern die Positivkontrolle (rDNA16s) in W1 positiv ausfiel. In diesem Fall findet sich ein ‚+‘ in der Spalte für rDNA. Bei negativem Ausfall wurde zunächst der Multiplex- Ansatz, dann die Extraktion wiederholt. Blieb das Ergebnis negativ, war von Inhibition der PCR auszugehen, was in der Ergebnisspalte mit ‚Erfolg‘ vermerkt wurde. Anmerkungen mit Seitenzahlen in der Ergebnisspalte beziehen sich auf die entsprechende Stelle in Laborbuch 1 und 2.

Tagung der Deutschen Gesellschaft für Hygiene und Mikrobiologie, Heidelberg, 10/2002

Abstract

Detection of enteropathogenic *Escherichia coli* strains in stool samples

Introduction: Enteropathogenic strains of *E. coli* cause up to 30% of all episodes of diarrhea worldwide ranging from traveler's diarrhea to hemorrhagic colitis. Definitive diagnosis of these strains relies on the detection of enterotoxins in stool samples or bacterial isolates. Only few commercial kits hampered by low sensitivities and time consuming performance are available for detection of a limited number of toxins of enteropathogenic *E. coli*.

Materials and Data: We therefore developed a multiplex PCR including 3 panels of primers. Panel I ("watery") used primers specific for uidA, SLT I (EHEC), STa, LT H (ETEC), and ECB (EPEC). Panel II ("bloody") used primers for uidA, SLT I (ETEC), ipaH (EIEC), whereas panel 3 ("children") those for uidA, SLT (EHEC), ECB (EPEC), and pCVD342 (EaggEC). Sensitivity of the PCR assay was as low as 1 CFU in stool. Between July and September 2001, 225 stool samples from patients with diarrhea (101 travelers, 124 children) were screened for the presence of enteropathogenic *E. coli* by all 3 multiplex PCR panels. 42 (18.3%) of all stool samples gave positive results by multiplex PCR. Of these, 22 were EaggEC, 13 EIEC, 7 ETEC, 3 EHEC, and 1 EPEC. In 19 (54.3%) of 35 cases, positive PCR results in stool could be confirmed by PCR from *E. coli* isolates after culture. The prevalence of enteropathogenic *E. coli* was highest among children <10 years of age (24.0%). In these, EaggEC showed the highest prevalence (50.0% of all positive results compared to 14.2% in the remaining samples). We observed loss of virulence genes during passage of strains on agar plates.

Conclusion: Multiplex-PCR detected enteropathogenic *E. coli* strains in between 18.3 and 24% of all stool samples. EaggEC showed the highest prevalence, especially among children <10 years of age. Multiplex PCR from stool samples appears useful for the rapid diagnosis of enteropathogenic *E. coli*.

Detection of enteropathogenic *Escherichia coli* strains in stool samples by multiplex PCR

Introduction:

Enteropathogenic strains of *E. coli* cause up to 30% of all episodes of diarrhea worldwide ranging from traveler's diarrhea to hemorrhagic colitis. Pathogenicity depends on factors of virulence, encoded on plasmids, phages or chromosomal. Definitive diagnosis of these strains in the past relied on serological detection of serovars or the detection of enterotoxins in stool samples or bacterial isolates by immunological methods. Only few commercial kits hampered by low sensitivities and time consuming performance are available for detection of a limited number of toxins of enteropathogenic *E. coli*. We therefore introduced a fast, sensitive and specific multiplex PCR method for screening of stool samples for the common *E. coli* pathovars ETEC (*enterotoxigenic E. coli*), EPEC (*enteropathogenic E. coli*), EHEC (*enterohemorrhagic E. coli*), EIEC (*enteroinvasive E. coli*) and EaggEC (*enteroaggregative E. coli*).

Tab.1: Enteropathogenic *Escherichia coli*

| Pathovar | ETEC | EPEC | EIEC | EHEC (=VTEC) | EaggEC |
|-------------------------------|---|---|--|---|--|
| Clinical symptoms of diarrhea | Watery, dikeh-like, i.p. travellers diarrhea | Watery | Sanguinous Shigella-like | 80% watery, 10% hemorrhagic, 10% secondary sickness, 5% lethal, HUS, TTP | Watery, persisting |
| Reservoir | Human, pigs, domestic animals | Human cattle | Human | Cattle domestic animals, human? | Human |
| Factors of virulence | Heat labile toxin (LT), heat stable toxins (ST) | Bundle forming pili, protease, cytolethal, type III secretory apparatus | Shiga toxin, invasion-associated locus | Shiga-like-toxins, heat stable enterotoxin, verocytotoxin, verocytotoxin, intimin, type III secretory apparatus | Heat stable enterotoxin, bundle forming pili |

Tab. 4: Specificity at 60°C annealing temperature

| Pathovar | SLT I | uidA | LT H | ST a | Shig ipaH | ECB | pCVd |
|------------|--------|--------|--------|--------|-----------|--------|--------|
| ETEC | - | - | 312 bp | 182 bp | - | - | - |

Tab. 7: Detection of *E. coli*-pathovars in children and travelers screened between July and September 2001 in Berlin

| Pathovars | Absolute number of positive samples | % | % of all positive samples | Positive samples: children (n = 124) | % positive of all children | % of all positive samples (children) | Positive samples: travelers (n = 91) | % positive of all travelers | % of all positive samples (travelers) |
|--------------------|-------------------------------------|------|---------------------------|--------------------------------------|----------------------------|--------------------------------------|--------------------------------------|-----------------------------|---------------------------------------|
| ETEC | 3(1) | 16.7 | 4 | 3.23 | 18.2 | 3 | 2.97 | 14.3 | 0 |
| EPEC | 1 | 0.44 | 2.38 | 1 | 0.81 | 4.55 | 2 | 0 | 9.5 |
| EHEC | 3 | 1.33 | 7.14 | 1 | 0.81 | 4.55 | 2 | 1.98 | 38.3 |
| EIEC | 13 | 5.78 | 31.0 | 6 | 4.84 | 27.3 | 7 | 6.93 | 42.9 |
| EaggEC | 22 | 9.78 | 52.4 | 13 | 10.5 | 59.1 | 9 | 8.91 | 42.9 |
| all <i>E. coli</i> | 46 | 18.7 | - | 25 | 17.7 | - | 21 | 19.8 | - |

Conclusions:

- Multiplex-PCR detected enteropathogenic *E. coli* strains in between 18.3 (all patients) and 24% (children <10) of stool samples
- EaggEC showed the highest prevalence with up to 59%, especially among children
- Multiplex PCR on stool samples appears useful for the rapid diagnosis of enteropathogenic *E. coli* strains

7.5. Danksagung

Zwar zuletzt, aber keineswegs an letzter Stelle, möchte ich mich bei den vielen netten Kollegen bedanken, die am Entstehen dieser Arbeit mitgewirkt haben. Ganz besonders sind dies die Ärzte und MTLA's in der Abteilung für Medizinische Mikrobiologie des Campus Benjamin Franklin der Charite, des Instituts für Laboratoriumsdiagnostik Labor für Mikrobiologie und Serologie im Vivantes- Klinikum Neukölln, des Zentrallaboratoriums des St. Joseph- Krankenhauses Berlin, des Tropenninstituts Berlin und der Gastroenterologischen Abteilung des Klinikums Ernst von Bergmann Potsdam.

Insbesondere möchte ich mich bei folgenden Personen bedanken:

A. Maletz, U. Rüschendorf, J. Imlau, J. Wagner, K. Miksits, R. Ignatius,
alle Abteilung Medizinische Mikrobiologie des Campus Benjamin Franklin der Charite

M. Ballentin, R. Küchler, Institut für Laboratoriumsdiagnostik Labor für Mikrobiologie und Serologie, Vivantes Netzwerk für Gesundheit, Region Süd (Berlin)

B. Amir-Moazami, Zentrallaboratorium im St. Joseph- Krankenhaus, Berlin

G. Burchard, Tropeninstitut, Berlin

T. Weinke, Klinikum Ernst von Bergmann, Potsdam

... und ganz besonders meinem Doktorvater

O. Liesenfeld
