

## 6. ACKNOWLEDGMENT

The research described in this dissertation would not have been possible without the help of many individuals, organizations and agencies. All of these are now acknowledged here, not necessarily in any particular order. My special thanks go to my advisers, Professor Dr. Holger Dau and PD. Dr. Michael Haumann, whose support and encouragement have enabled me to overcome the various research problems noted in the following chapters.

Their intellectual heft, guidance and direction have been crucial in my development as a biochemist and as a scientist. Dr. Michael Haumann has given me day-to-day and hands-on direction and advice, and mentored me early in my career. He has spurred my growth and grasp of this research field. Thanks go to him for this patience and perseverance in dealing with me. I appreciate the efforts of my dissertation advisor, Prof. Dr. W. Sanger, who, along with Prof. Dau and Dr. Haumann have read through my dissertation.

I am grateful to the Deutsche Forschungsgemeinschaft (SFB 498, Projekt C6) for the position given to me at the start of my research and the Fachbereich Physik der Freien Universitat Berlin for the support in my experiments.

Synchrotron radiation was provided by the European Synchrotron Radiation Facility (ESRF, Grenoble), Deutsches Elektron- Synchrotron (DESY, Hamburg); Berliner Elektronenspeicher- ring- Gesellschaft fur Synchrotronstrahlung (BESSY, Berlin).

Over the course of my time in the Dau Laboratory, I have been privileged to work with outstanding members of the Dau research group. The past members of the Dau Group are thanked for their advice and transferred knowledge. I thank Dr. Peter Liebisch for getting me started on the EPR/Mn determination and on x-ray absorption spectroscopy. Dr. Markus Grabolle helped me to get started with the prompt and fluorescence measurements, Dr. Claudia Muller helped me to get started with AAS measurements and Monika Funning with the preparation of the PS II membranes.

My co-workers for the Chapter of photoactivation include Paola Loja, Alexander Grundmeier, Dr. Roland Krivanek, Simone Loscher, Dr. Michael Haumann and Prof. Dr. Dau all of whom I thank for their help in data collection.

As the preceding paragraphs have shown, EPR, AAS, spectroscopy measurements and XAS- EXAFS data collection is a team effort and so I express my gratitude to the (mostly) current team of Dau's group for their energy, effort and enthusiasm, which I have benefited and gained from enormously.

The technical support personnel and staff at ESRF (Dr. Thomas Neisius), DESY (Dr. Wolfram Meyer-Klaucke) and BESSY (Dr. Franz Schäfers and Marcel Mertin) also deserve recognition for their help in making the experiments.

I express my deepest gratitude to Ina, Raúl y Dieter, who has patiently provided emotional, family, and physical support and encouragement driving some of the more difficult moments I have gone through in Berlin.

I am grateful for the daily support made by our dear secretary Marion Badow, who not only assisted me administratively, but who also provided me with very important advices.

Finally, the years at the Free University of Berlin have been made worthwhile by my interactions with the students, faculty and staff of the Physics Department and with the assorted members of the Dau Lab. To all of them go my sincerest thanks, respect and appreciation.
