

Acknowledgements

This thesis would never have been achieved if it were not for the teaching, help and advice from a number of people who I would like to take this opportunity to thank.

First, I would like to thank Prof. Dr. Wolfram Saenger, for providing, not only the laboratories in which this work was performed, but also the group of talented scientists who made the day-to-day work both educational and enjoyable.

I deeply thank my direct supervisor, Prof. Dr Norbert Sträter. He has been a great teacher whose calm and positive leadership endured through even my most frustrated moments.

I wish also to thank Dr Birgitta Beatrix, who has provided friendship and support through difficult times and places. Our discussions over coffee were the highlights of my day.

I cannot thank enough Timm Maier, who took on the task of teaching me and for whom no question was too stupid and no computer problem too small. Without his help and support, I doubt I would ever have finished.

I also want to thank Robert Schultz-Heienbrok for always being the calming voice of reason, the eternally unflappable. He provided me with transport and a home, and was always a willing source of advice and help.

To the person who has stood by me, Roman Hillig – all I can say is thank you, from the bottom of my heart.

Finally I wish to thank my parents. Without their permanent and unfailing belief in me I would never have made it across the world to achieve this. Thank you.
