

ACKNOWLEDGMENTS

I would like to thank my supervisor Prof. Dr. Hans-Jürgen Götze for supervising this work; for letting me to discover the charms of geophysics, geology and particularly gravimetry also in the field! Our '02 campaign will certainly remain one of the most adventurous and greatest experience in my life. Thanks for showing me a direction when I was lost and for "throwing me into a cold water" (so I could learn how to do and present a scientific work and how to solve "insitu" problems). I would like to thank for a very good working environment and for having possibility to participate at numerous international workshops and conferences. I am thankful also for help with the thesis, for the corrections, comments, critique, as well as help with many "little" problems that not always dealt only with geophysics. Last but not least, "ich werde nie vergessen unser Duett Flöte-Bratsche an einem Sonntag Nachmittag".

I would like to thank the second reviewer Prof. Dr. Volker Haak for the time he invested into reading and commenting this thesis.

I am also thankful to my external supervisor Dr. Miroslav Bielik for help, useful comments and introduction to the world of gravity anomalies. Thanks for the support, friendship, understanding and for letting me to go my way.

I would like to thank the SFB 267 and DFG for financing this project, and giving me possibilities to take part in conferences, workshops and field measurements. Thanks to Dr. Peter Wigger and "his team" for organization of the SFB events.

I would like to thank colleagues of the F4 project of the SFB 267 (Prof. Dr. H.-J. Götze, Prof. Dr. G. Franz, Dr. R. Hackney, Dr. F. Lucassen, Dr. U. Meyer, Dr. S. Schmidt, Dipl.-Ing. D. Marchenko, Dipl.-Geol. D. Melnick, Dipl.-Geol. A. Tassara and Dipl.-Geophys. S. Wienecke) for cooperation, shared ideas, results, figures; thanks for regular meetings, useful comments and discussions about the Southern Andes. I would like to express my thanks also to other SFB colleagues, such as Dr. Mirjam Bohm, Dr. Stefan Lüth and Dr. Xiaohui Yuan for their results and data they provided; Dr. Johannes Glodny for the help with density measurements and other very useful comments; Dr. Jim Mechie for useful discussions about the geophysical data in Southern Chile; Dr. Uwe Meyer for gravity anomaly and geoid discussions, Dr. Jo Lohrmann for discussions and for showing me one of the sand-box experiments; Dr. Amir Abolghasem for his help and comments about the geodetic stuff, stresses and the coupling zone.

Many thanks go to the members of the gravity working group, so called gravimatrix-en! To Dipl.-Inform. Stefan Pohle for taking care of the computers, printers, network and the house-administration because all normally works very well; Dr. Jörg Ebbing for introducing me the IGMAS and other useful tools in the house I used for the work; Dr. Tanja Romanyuk and Dipl.-Geophys. Kusumita Arora for useful discussions on many different subjects; cand.-Geophys. Tanja Kollersberger for help with the curvature technique, as well as for many other "little" things that make "das Forschen fröhlich, einfacher und effektiv"! Thanks to Kirsten Borchardt for help with preparation of some of the figures for this thesis (now you can be sure there won't be any other IGMAS figure to be converted into GMT!); and Dr. Norbert Ott for useful comments.

Special thanks go to Dr. Sabine Schmidt for answering my SOS messages concerning IGMAS, for providing all sorts of different grid files and other useful data (and even sending them to Chile if necessary!), and for leading our seminars that were "echt toll!"; to Dipl.-Geophys. Toby Müller-Wrana and his family for help with numerous things during the first two years of my work, as well as for the adventurous, "obwohl manchmal anstrengt", field campaign in Chile and Bolivia in 2002; and I would also like to thank Dipl.-Geophys. Susann Wienecke for her time and help with various things concerning the work, geophysics, anomalies (and not only the geophysical ones), especially during the first years of my life in Berlin. I am happy that we could walk a piece of our way together because I could discover many new things about life, myself and the world around.

Very special thanks go to Dr. Ron Hackney for the effort and time he spent reading and correcting my thesis and for his useful criticism, as well as help with GMT, patience with answering and explaining things, always a good mood and a smile on the face, willingness to help with any problem, for numerous discussions about geo-sciences, modelling and also many other topics; and to Dipl.-Geol. Andrés Tassara for many joyful discussions about the Andes from a geological point of view, for explaining and "translating" some fascinating expressions from geology and mineralogy, for providing useful articles and for cooperation with the density determination.

I would like to thank Dipl.-Geol. Allison Britt and Dr. Kevin Flemming for reading and correcting the manuscript.

I am thankful to Dr. Roman Pašteka for performing the Euler deconvolution calculations; and also to my formal colleagues in the Academy of Sciences in Bratislava for a very pleasant working environment and support.

Thanks to Dipl.-Geophys. S. Werner for help with translation and the good coffee.

I would like to thank my family for support, understanding and for patience.

Ďakujem rodičom za krásny a pokojný domov a najmä za možnosť bezstarostne študovať, ktorú mi tak samozrejme poskytli. Sestre ďakujem za jej "oko", ktoré nado mnou bdie odkedy som sa narodila a stráži, hoc aj vzdialene, moje kroky.

Last but not least I would like to thank Paolo Alasonati, my new family, my best friend and, at the same time, my strictest critic for his comments, help and support with this work.

Grazie Paolo per tutto, per molte cose che non posso qui riportare, ma specialmente, grazie per il colore che hai portato nella mia vita.

Many figures in this thesis were prepared using the *GMT (Generic Mapping Tool)* software package (Wessel & Smith, 1991; Wessel & Smith, 1998), freely available program for map making and numerous other geophysical and geological tasks. The text was written using *OpenOffice*, open-source project (Sun Microsystems).
