

Kontrollgruppe. 5-FU unterdrückte die Fibronectinexpression ab Tag 15 signifikant besser als Genistein oder Suramin.

Unterschiede zwischen aktivierten und nicht-aktiviert Tenonfibroblastenpopulationen konnten mit statistischer Signifikanz lediglich in der Fibronectinexpression festgestellt werden. Diese Unterschiede wurden durch die medikamentöse Behandlung, unabhängig davon mit welchem Medikament sie erfolgte, unterdrückt.

Zusammenfassend hemmen sowohl Genistein als auch Suramin die einzelnen Funktionen des Tenonfibroblasten signifikant. Diese Hemmung erstreckt sich über einen mindestens vier Wochen dauernden Zeitraum. Genistein hat dabei in einzelnen Zellfunktionen zeitweise eine stärkere Wirkung als das etablierte 5-FU und ist in seiner Wirkung mit 5-FU vergleichbar. Suramin hatte einen schwächeren Effekt auf die Fibroblastenfunktionen als 5-FU.
