
Acknowledgments

I would like, in first place, to thank my two advisors, Prof. I.V. Hertel and Prof. Audouard. Professor Hertel made me feel welcome in his laboratory, from my very first attempts to be an experimental scientist, four years ago, to the very last lines of this document. I had the chance to benefit of his advise and guidance. I could also benefit of his talents as an orator as Prof. Hertel always shown great enthusiasm to promote our results to the scientific community, from Berlin to Kyoto. Finally, I would like to thank him for his help in coordinating the procedures between the French and German universities.

From Prof. Audouard, I received the trust and the support that were required to start, to go through, and to finish this great scientific adventure. He was the initiator of the "cotutelle" procedure, which allowed me to share my research time between Saint-Etienne and Berlin. From a human and from a scientific point of view, he always had the clairvoyance to trigger the small mechanisms resulting in huge positive things. I feel very lucky that I spent the past years under his supervision.

It would take a whole thesis to express my thanks to Dr. Stoian. He followed me since the very beginning of my scientific life. Dr. Stoian was the one continuously encouraging me to learn and to make more, better and faster. He finally managed to make me believe that with enough work, making good science was possible. During four years, I could never detect the slightest decrease in his deep passion for physics. People like him undoubtedly make the field attractive and healthy. Thanks for all.

I would also like to thank all the members from my evaluation commission. It is an honor to submit my work to Prof. Solis, Prof. Petite and to Dr. Salin, who accepted to be the president of my thesis committee. I would like to thank Prof. Petite for the fascinating hours spent at the phone listening to his explanations on free carrier generation and on the

chemistry of glasses. He is the kind of person making you feel more intelligent. When he talks about science, everything seems easy.

I would like to thank the head of the Physics Department at the FU Berlin, Prof. Stehlik and his predecessor, Prof. Kaindl, for their kind understanding and support all along the thesis submission procedure, as well as Mr. Gibian and Fr. Pasanec.

On the French side, I would like to thank Prof. Dujardin for letting me attend his excellent class in solid state physics at the Université Lyon I, as well as Prof. Y. Ouerdane for letting me attend his course in quantum mechanics.

Dr. Arkadi Rosenfeld deserves more than those few lines. During the years I spent in his office, he brought much more than science into my life. I wish that one day, I could be the same colleague and project leader as he was. Thank you Arkadi. Wholeheartedly.

I had the chance to work with Dr. Boyle and Dr. Bonse, and I would like to thank them here for their invaluable help with the pump-probe experiment. Cyril Mauclair was extremely helpful for the waveguide characterization and deserves many sincerer thanks for this. Thanks to Roman "goldfinger" Peslin for his unbelievable skills and good mood, and to Fr. Lekve and Fr. Winter, for their efforts to understand and solve all my administrative problems. Special thanks to Prof. Weinelt for the interesting conversations we had together and for his invitations to the christmas meals with the whole A1 department. Thanks to all the students who made life much more enjoyable in France and Germany, especially Nicolas Sanner, Jean-Philippe Colombier, Igor Burakov, Lutz Ehrentraut, Elena Prima-Garcia, Simon Rivier and Helmut Lippert. A special thank goes to Herr Sebastian Winkler.

On the other side of the Atlantic ocean, I would like to thank Dr. C.B. Arnold, for giving me the opportunity to join his group at the University of Princeton as a postdoc. This wonderful perspective provided me the peace and the courage I needed to hold the deadlines for writing this manuscript.

I would also express my deepest gratitude to all the French and German citizens who work everyday and pay taxes so that us, scientists, can play our favorite game in excellent conditions. I sincerely wish that the little amount of knowledge contained in the following pages will one day help the society to live in a world a little bit better.

The next paragraph is dedicated to my friends. I can not cite them all here, and I apologize for that. For the French part I just would like to give a special thank to Jean-Baptiste Charvier. A special thought goes to Julien. On the German side, a very special thank goes to Lars Löllmann, for his continuous and invaluable friendship.

Christina, the last paragraph is for you. It is certainly not the right place to make a declaration, but I just want you to know that without you, I would still be aimless. Thanks for pulling the man out of me.
