

# Acknowledgements

This thesis has been elaborated at the Fritz Haber Institut der Max Planck Gesellschaft, whose support I want to thank in the first place.

I would like to express my gratitude to Prof. Phil Woodruff for his thoughtful supervision, his appropriate suggestions, the thorough discussions we had, his patience and for being able of doing all these in a friendly way.

I want to thank the other members of the group their collaboration. Specially, I want to thank Martin Polcik and Martin Kittel for being always there. Mathieu Pascal and Gareth Nisbet are acknowledged for making the long beamtimes at BESSY more enjoyable. I want to thank Rachel Toomes her calm presence and her carefulness in all she did during the experiments. I thank Faik Demiros for showing me a side of the Islamic religion I was not aware of.

Rob Lindsay is acknowledge for his precious collaboration in the study of the adsorption of formic acid on  $\text{TiO}_2(110)$ .

I am also very grateful to Prof. Karsten Horn for providing me the financial support, for his openness to discuss different aspects of scientific life and for accepting being my first *Gutachter* at the University.

I would like to thank Prof. Martin Wolf for being my second *Gutachter* and for giving me the opportunity to present and discuss my work with his research group.

I also thank Dr. Uwe Hergenhausen for the “enlightening” discussions on circular dichroism in photoemission from chiral molecules.

I am also very grateful to Dr. Elisa Román who kindly provided the  $\text{TiO}_2$  crystal sample used in this work. This really saved us from an experimental crisis at BESSY.

Finally, I want to thank all the people that have accompanied me during this period. Massimo and Francisco (el *Rey de Bornholm*), thanks for your unconditional friendship. Paco, I will never forget your continuous (and, fortunately, unsuccessful) tries to flood BESSY. Fabrice, Luis, Aswhani and Uwe, thanks to all of you for the nice atmosphere at work.
