

## Acknowledgements

First of all I would like to thank my supervisors Wolfgang Uckert and Thomas Blankenstein for giving me the opportunity to work in their laboratories and for providing me with the topic. Wolfgang Uckert taught me my first steps in handling retroviral vectors, gave me space to find my position within the two lab groups, and let me have a glance into the politics in science. Thomas Blankenstein always found time to discuss science, and never let me down when having trouble getting a paper published. His critical view on tumour immunology is quite addictive.

What would I have done without the technical expertise of Irmgard Küttner, who taught me “run” in cell culturing (and also kept our lab running). Great help I also obtained from Martina Grabbert.

I would also like to thank my colleagues in both groups for technical and moral support, as well as for all the fun we had in between (and also during) work. Excuses to everybody whom I do not mention by name. Exceptions are Thomas Kammertöns who was always there to have a good chat about science and colleagues, Felicia Pradera who brought some Latin blood into the “Nordic” group, and Matthias Leisegang who showed me how much fun supervising can be (he was also a good office neighbour).

Some of the experiments (maybe the most important) were done in Munich, where I had the pleasure to work with Elfriede Nößner. Together we had very fruitful discussions with Dolores Schendel.

I want to warmly thank my parents for making it possible for me to study and carry on with science, as they supported me by all means (not only great Italian food).

Finally, a big “Thank you!” to Maja who stood by me even during the time when all I could say was: “Ich muss weiterkommen!” and who reminded me of better things with her endogenous joy.
