Striving for Gains and Preventing Losses:
Multi-Method Evidence on the Differences in Personal Goal Orientation in Early and Late Adulthood

Natalie C. Ebner

Dissertationsschrift zur Erlangung des Doktorgrades der Philosophie am Fachbereich Erziehungswissenschaft und Psychologie der Freien Universität Berlin

Berlin, 11. April 2005

Gutachter:

# TABLE OF CONTENTS

ABSTRACT .................................................................................................................................................... xii

INTRODUCTION ............................................................................................................................................... 1

THEORETICAL BACKGROUND .................................................................................................................... 4

Lifespan Development Is Characterized by Gains and Losses ................................................................. 5

The Ratio of Gains to Losses Changes Across the Lifespan: Subjective Beliefs About Developmental Change and Objective Developmental Change .................................................................................................................. 6

Lifespan Trajectories of Cognitive and Physical Functioning .................................................................... 8

Integrating Lifespan Development and Action Perspectives: Development as Flexible and Adaptational Person–Environment Interaction ......................................................................................................................... 11

Normative Age-Graded, Normative History-Graded, and Non-Normative Interacting Developmental Forces and the Concept of Developmental Tasks .......................................................................................................... 12

Active Life-Management—Resources, Goals, Actions, and Development ................................................ 16

The Concept of Resources ............................................................................................................................ 16

The Concept of Personal Goals .................................................................................................................... 18

The Interplay of Goal-Related Resources, Goals, Goal-Directed Actions, and Development .................. 22

Excursus: Life-Management Encompasses Automatic, Unintentional, and Unconscious Processes ............ 24

Balancing Gains and Losses: Adaptive Development Over the Lifespan .................................................. 27

What is Adaptive Development and What Are Processes That Favor it? ................................................... 27

Subjective Well-Being as One Possible Criterion of Adaptive Development .......................................... 29

How Goals and Goal-Related Processes Impact on Adaptive Development ............................................ 30

The Model of Selection, Optimization, and Compensation—A General, Meta-Theoretical Framework for Understanding Adaptive Development ............................................................................................................. 31

Adaptive Development as Endorsement of Selection, Optimization, and Compensation Throughout Life ........................................................................................................................................................................ 34

Two Additional Models of Successful Development .................................................................................... 38

The Dual-Process Model of Assimilative and Accommodative Mode of Coping ...................................... 38

Adaptive Development as Shifting From Assimilative to Accommodative Mode of Coping Throughout Life .................................................................................................................................................. 40

The Model of Optimization in Primary and Secondary Control .................................................................. 41

Adaptive Development as Shifting From Primary to Secondary Control Strategies Throughout Life .......... 42

Lifespan Developmental Psychology as Integrative Framework: Personal Goal Orientation From a Lifespan Perspective .............................................................................................................................................. 44

Personal Goal Orientation as One Personal Goal Characteristic: Approach—Avoidance Motivation ........ 45
EMPIRICAL FINDINGS .............................................................................................................. 87

General Statistical Procedures ............................................................................................. 87

Statistical Software Package and General Data Handling ..................................................... 87

Missing Values, Outliers, Normality, Internal Consistency, and Temporal Stability ........... 87

Additional Assumptions of ANOVA ..................................................................................... 89

Additional Assumptions of Multiple Regression Analysis .................................................. 89

Significance Level and Alpha-Level Adjustment in Multiple Testing .................................... 89

Study 1: Self-Reported Personal Goal Orientation I. .............................................................. 90

Study 1: Specific Research Hypotheses ................................................................................ 91

Study 1: Methods .................................................................................................................. 91

Procedure ............................................................................................................................. 91

Participants .......................................................................................................................... 92

Recruitment ......................................................................................................................... 92

Sociodemographic Characteristics ....................................................................................... 92

Cognitive and Physical Functioning ..................................................................................... 93

Measures ............................................................................................................................... 94

Generation of Personal Goals ............................................................................................. 95

Personal Goal Orientation in Self-Generated Goals .............................................................. 97

Personal Goal Orientation of Goals in Various Life Domains .............................................. 98
Subjects 3a and 3b: Behavioral Preference for Personal Goal Orientation

Study 2: Self-Reported Personal Goal Orientation II

Study 2: Specific Research Hypotheses

Study 2: Methods

Procedure

Participants

Recruitment

Sociodemographic Characteristics

Cognitive and Physical Functioning

Measures

Generation of Personal Goals

Personal Goal Orientation in Self-Generated Goals

Correlate and Control Variables

Study 2: Results

Description of Goal Orientation Toward Growth and Maintenance–Prevention of Loss

Interrelatedness of Goal Orientation Toward Growth and Maintenance–Prevention of Loss

Personal Goal Orientation in Younger and Older Adults

Replication of Age-Group Differences in Personal Goal Orientation of Self-Generated Goals

Age-Group Differences in Personal Goal Orientation of Goals in Various Life Domains

Age-Differential Associations Between Personal Goal Orientation and General Subjective Well-Being and Goal Satisfaction

Study 1: Summary and Short Discussion of the Findings

Study 1: Results

Description of Goal Orientation Toward Growth, Maintenance, and Prevention of Loss

Interrelatedness of Goal Orientation Toward Growth, Maintenance, and Prevention of Loss

Personal Goal Orientation in Younger and Older Adults

Age-Group Differences in Personal Goal Orientation of Self-Generated Goals

Age-Group Differences in Personal Goal Orientation of Goals in Various Life Domains

Studies 3a and 3b: Behavioral Preference for Personal Goal Orientation

Studies 3a and 3b: Specific Research Hypotheses

Study 3a: Methods

Procedure

Participants

Recruitment
Orientation Toward Maintenance and Prevention of Loss in Old Age

Subjective Theories About Developmental Trajectories: Reduced Awareness of Potentials for Critical Life Events May Change Personal Goal Orientation and Expected Resource Demands

The Shift in Personal Goal Orientation Reflects Age-Graded Changes in Goal-Related Resources and Expected Resource Demands

Critical Life Events May Change Personal Goal Orientation

Subjective Theories About Developmental Trajectories: Reduced Awareness of Potentials for Developmental Growth and Lowered Perceptions of Personal Control Over Development

Age-Graded Changes in Future Time Perspective Play a Role in Explaining Age-Related Differences in Personal Goal Orientation
Study 3a: Relations of Personal Goal Orientation to Concepts of Goal Resources and Additional Goal Characteristics ..............................................................257
Study 3b: Additional Information on Instructions of the Central Measurement Instruments ...............................................................258
Study 3b: Additional Descriptive and Psychometrical Information on the Central Variables .................................................................259
Study 3b: Additional Descriptive and Psychometrical Information on the Correlate Variables .................................................................261

ACKNOWLEDGMENTS

I conducted my dissertation studies within the project “Selection, Optimization, and Compensation: Goals and Preferences in Lifespan Development” (principal investigators: Prof. Alexandra M. Freund (until December 2002), Dr. Michaela Riediger (since January 2003), Prof. Paul B. Baltes, and Prof. U. Lindenberger) at the Center for Lifespan Psychology of the Max Planck Institute for Human Development in Berlin (MPIB). I was financially supported by a predoctoral position at the MPIB. While working on my dissertation, I participated in two doctoral training programs: The Graduate Program “Neuropsychiatry and Psychology of Aging”, a joint initiative of the Free University of Berlin and the MPIB, and the International Max Planck Research School “The Life Course: Evolutionary and Ontogenetic Dynamics (LIFE)”, a joint initiative of the Free University of Berlin, the Humboldt University Berlin, the University of Michigan Ann Arbor, and the MPIB.

First of all, I want to thank Prof. Paul B. Baltes for the great opportunity I had to work in the excellent academic environment of his Center for Lifespan Psychology. He constantly showed interest and generously shared his scientific expertise with me in supervising my studies. My deepest gratitude goes to my advisor Prof. Alexandra M. Freund. She devoted enormous amounts of time, thoughts, and motivation into my work. She read several versions of my proposal and this dissertation, supported me when I presented my studies, and provided me with invaluable information on people, conferences, meetings, and workshops. Discussing various issues of my dissertation with her was always challenging, at the same time highly enjoyable, and I learned a lot from her. During the last three years, she was not only a great mentor but my friend.

I thank all former and current members of the Center for Lifespan Psychology for fruitful debates on my studies. I appreciate having had the opportunity to participate in the two graduate programs and thank the Steering Committees and my fellows for their feedback and support. I am very grateful to the people who helped me in the long and manifold process of conducting my dissertation project: Many thanks go to Dulce Erdt, our technical research assistant, to our student research assistants Dipl.-Psych. Poldi Kuhl, Ulrike Altmann, Antje Rauers, and to our interns Karl Kapitza, Tobias Raabe, Sanja Hodjic, and Marie Hennecke for their assistance during all phases of my work. Working with all these people was a great pleasure to me. For their very helpful advice on theoretical, statistical, and practical matters, I feel enormously thankful to Dr. Albina Bondar, Dipl.-Psych. Susanne Scheibe, and Dr. Michaela Riediger, who also commented on an almost final version of my dissertation. Very special thanks also go to Dr. Julia Delius who proofread this manuscript and improved its English with an incredible professionalism, thoroughness, and friendliness.

I want my parents to know that their interest in my work and their emotional support with respect to work and life outside work means very much to me. I deeply thank my friends Britta Burth, Albina Bondar, Sabine Schafer, Susanne Scheibe, and Stefan Brauckmann for having always been there during these really good and really bad days. And Jörg, for all there was and is to come.
