**THE ECOLOGICAL RATIONALITY OF HEURISTICS AND
THEIR BUILDING BLOCKS:
THE MAKING OF ADAPTIVE DECISIONS**

Dissertation
zur Erlangung des akademischen Grades
Doktorin der Philosophie
(Dr. phil.)

vorgelegt von
Dipl.-Psych.
Anja Dieckmann
Berlin, 2004

Erstgutachter: Prof. Dr. Gerd Gigerenzer

Zweitgutachter: Prof. Dr. Arthur M. Jacobs

Disputationstermin: 18. Februar 2005

ACKNOWLEDGMENTS

The present dissertation summarizes work I conducted as a predoctoral research fellow at the Center for Adaptive Behavior and Cognition (ABC) of the Max Planck Institute for Human Development. The three years I spent there were an eventful and intellectually challenging time. First, I want to thank my three advisors who helped me face the challenges by providing valuable input at all stages of my research.

I thank Gerd Gigerenzer for the opportunity to work in such an inspirational place and for the trust he has placed in me from the start. He sets exemplary standards in promoting students by granting them a high level of freedom and responsibility, while always taking time to provide helpful advice.

Jörg Rieskamp taught me how to program in Matlab, and provided constructive criticism on the design and analyses of the studies summarized in the second chapter of this dissertation. He was the most helpful and reliable advisor one could wish for.

The last chapter is the result of a collaboration with Peter Todd. One will rarely find a person who combines such a high level of intelligence with a matching level of social competence. In our regular meetings, Peter not only provided brilliant ideas, but also encouragement, thus helping me face the many struggles associated with my dissertation.

Without Uwe Czienskowski the experiments reported in the second and third chapter could not have been carried out – which he would surely confirm after his many desperate attempts to teach me computer languages for programming experiments. I cannot thank him enough for taking over that job. At the same time, he was always helpful in providing ad hoc statistical advice.

Gregor Caregnato, the most charming experimenter in the world, and Sonja Schulze, made sure that the participants in my experiments made a total of 27,360 decisions without complaint.

I thank Anita Todd for correcting my English, as well as Stephanie Kurzenhäuser and Andrea Lücking for very helpful feedback on some of the chapters. In addition, I thank all three of them for their encouragement. Thanks to Hartwig Schröder I gained some interesting insights into the fascinating science of oil mining. Gregor Lämmel did a great job programming part of the simulations for the second chapter. Furthermore, I am very grateful to Rona Unrau, Tim Johnson, Julia Schooler, and Lael Schooler for their last-minute advice.

Of course, all my colleagues at ABC have provided important feedback during presentations or informal discussions. Their contributions were not only scientific; their humor, helpfulness and friendship have made working at ABC such a great experience.

On a more personal note, I want to thank my family for their support: I thank my parents Anneliese and Clemens Dieckmann, as well as my sister Irene Dieckmann, for always caring for me – they will all be as relieved as I when this dissertation is finished. I also thank my dear uncle Hans Dieckmann; he has encouraged and supported me in my plans to pursue a PhD from the very beginning. And I thank my uncle Hermann Bär for his support and his enjoyable visits to Berlin.

I thank Andreas Sinzinger, my soul mate, for supporting me. And I thank all the friends who I have neglected over the past months – I promise that from now on, I will again have time to listen, return phone calls, and reciprocate dinner invitations.

Anja Dieckmann

TABLE OF CONTENTS

PREFACE	1
----------------	---

CHAPTER 1

Setting the Stage:

Elements of Decision Heuristics	4
---------------------------------	---

Introduction	4
--------------	---

Heuristics	6
------------	---

Aim	8
-----	---

Building blocks of heuristics: An illustration	10
--	----

Search rules	13
--------------	----

Unfamiliar environments	15
-------------------------	----

Stable environments without outcome feedback	16
--	----

Stable environments with outcome feedback	18
---	----

Changing environments	27
-----------------------	----

Stopping and decision rules	31
-----------------------------	----

Compensatory versus non-compensatory environments	35
---	----

Correlations between cues	39
---------------------------	----

Information costs	40
-------------------	----

Presentation format	45
---------------------	----

Discussion	46
------------	----

CHAPTER 2

Putting Adaptive Strategy Selection to a Test:

Information Redundancy in Probabilistic Inferences	48
--	----

Introduction	48
--------------	----

Simulation Study	52
------------------	----

Strategies for probabilistic inferences	52
---	----

Testing the strategies	53
------------------------	----

Method	54
--------	----

Results	55
---------	----

Discussion	57
------------	----

Experiment 1	58
--------------	----

Method	59
--------	----

Results	62
---------	----

Discussion	67
------------	----

Experiment 2	68
Method	69
Results	70
Discussion	74
General discussion	76

CHAPTER 3

Taking One Step Back:

Simple Ways to Construct Search Orders	81
---	-----------

Introduction	81
Experimental evidence for ordered search	82
Search order construction – the hard way	83
Many roads lead (close) to Rome	85
Search order construction – the simple way	85
Simulation study of simple ordering rules	88
Results	89
Discussion	93
Experiment	94
Method	95
General results and adherence to TTB's building blocks	99
Discussion of the general results	110
Testing cue order learning rules	111
Discussion of the learning rules' fit	117
General discussion	120

SUMMARY AND CONCLUDING REMARKS	125
