Discrete Differential Operators on Polyhedral Surfaces – Convergence and Approximation

Max Wardetzky

A Dissertation submitted
to the Fachbereich Mathematik und Informatik, Freie Universität Berlin
in partial fulfillment of the requirements for the degree of
doctor rerum naturalium

Referees:
Prof. Dr. Konrad Polthier, Freie Universität Berlin
Prof. Dr. Alexander I. Bobenko, Technische Universität Berlin
Prof. Dr. Jean-Marie Morvan, Université Claude Bernard Lyon 1

Defended 8 November 2006

Acknowledgments

I thank my advisor, Konrad Polthier, for providing fertile ground on which this thesis could grow. I am deeply indebted to my friend Michael Herrmann, in particular, for numerous discussions which tremendously helped to clarify the functional analytic concepts of this work. I thank Klaus Hildebrandt, friend and colleague, for not getting tired of listening, and having critically discussed many aspects of this thesis with me.

I am grateful to several people for their encouragement and for many stimulating discussions: Alexander I. Bobenko, Eitan Grinspun, Anil Hirani, Tim Hoffmann, Jean-Marie Morvan, Peter Schröder, and Günter M. Ziegler. It has been a pleasure to work in an environment where many aspects of discrete differential geometry saw the light of the day. I thank Richard Evan Schwartz and William Goldman, my mentors at the University of Maryland, for sharing with me their beautiful and inspirational ways of thinking about geometry.

I thank my family, my wife and two daughters, for their support and understanding. At times they have had to endure a bad husband and neglectful father. The last day before handing in this work, I had the following conversation with my older daughter: "Daddy, you are always so busy. Can I help you?" "How do you want to help me?" "Well, I already know that hundred plus hundred is two hundred..."

My research was support by the DFG Research Center Matheon "Mathematics for key technologies" in Berlin.

Contents

1 Introduction **1**

2 Polyhedral surfaces **7**
2.1 Metric structure 7
2.2 Sobolev theory on polyhedral surfaces 9
2.2.1 L^p-spaces 10
2.2.2 Calculus of variations 10
2.2.3 Weak derivatives 12
2.2.4 Rellich lemma and Poincaré inequality 16
2.2.5 Laplace–Beltrami and Dirichlet problem 17
2.2.6 A glimpse at regularity 18
2.3 Discrete function spaces 20
2.3.1 Conforming and nonconforming elements 20
2.3.2 Discrete Dirichlet problem 23
2.3.3 Delaunay discretization 23
2.3.4 Mass matrices and discretized functionals 24
2.4 Discrete differential operators 25
2.4.1 Complex structure 26
2.4.2 Divergence and Gauss' theorem 27
2.4.3 Curl and Stokes' theorem 28
2.4.4 Laplace–Beltrami 29
2.4.5 Mean curvature 30
2.5 Algebraic topology from FE 33
2.5.1 Discrete de Rham complex 35
2.5.2 de Rham cohomology 36
2.5.3 Hodge decomposition 38
2.5.4 Local parameterization and Poincaré index theorem . . 41
2.5.5 Hodge-star for harmonic vector fields 43
2.5.6 Holomorphic and anti-holomorphic vector fields 45
2.5.7 CR equations and parameterization 46

3 Convergence and Approximation **49**
3.1 Overview 49
3.1.1 What will be shown? 50

3.1.2 What can go wrong? 50
3.2 Normal convergence 51
3.2.1 Shortest distance map 51
3.2.2 Metric distortion in geometric terms 54
3.2.3 Equivalent conditions for convergence 57
3.3 Convergence of metric properties 64
3.3.1 Dirichlet problem 64
3.3.2 Finite Element discretization of the Dirichlet problem . 67
3.3.3 Mean curvature as a functional 73
3.3.4 Discrete minimal surfaces 74
3.3.5 Mean Curvature as a function 76
3.3.6 Geodesics 79
3.4 Convergence of algebraic properties 80
3.4.1 Whitney forms I: Overview 81
3.4.2 Whitney forms II: Metric perturbation 85
3.4.3 Convergence of algebraic FE 91
3.5 Convergence rates for inscribed meshes 98
