

Acknowledgment

I wish to thank, first of all, Ludger Wöste and Knut Asmis for many years of first-class teaching and of patient supervision, and for the privilege they generously gave me of taking part in their research team. I shall never forget all the encouragement and help I had from them. I warmly thank Gerard Meijer for his teaching and for the invaluable intellectual stimulation and help I have had from him over the years. I was accompanied in my work by Mathias Brümmer, Cristina Kaposta, Carlos Cibrian, Oliver Gause, and Sara Fontanella and I gratefully thank them all. Special thanks to Mathias for innumerable discussions and a lot of good advice. His “electronic lessons” were invaluable. In the last year, several researchers joined our group: Torsten Siebert, Shaohui Li, Zhang Xin, Aldo Mirabal, Bruno Schmidt, Juri Demuth, Daniel Lockau, and Waldemar Unrau. I wish them all a great scientific future. Also, I wish to thank Torsten Siebert for all the interesting discussions we had and for his careful reading and commenting of this work. Many thanks to Ewald Janssens who made the experiments on bimetallic systems possible by his dual target laser vaporization source. It is a great pleasure to be able to thank each and every member of the Arbeitsgruppe Wöste, in particular Frau Siegel, for the friendly atmosphere and the wonderful working conditions I was able to enjoy for many years. I wish to thank engineer Michael Kregielski and all the members of the *Feinwerktechnik* and *Elektronik* workshop, in particular Wolfram Krüger, Marian Luft, and Detlef Müller.

None of the experiments presented in this work would have been possible without the skilled FELIX staff. In particular I warmly thank René van Buuren, Britta Redlich, and Lex van der Meer. Working with professor Joachim Sauer and his theory group was very fruitful. I am deeply grateful to him and to Jens Döbler, Marek Sierka for the many hours and emails of patient explanations.

Part of this research is the result of work done in collaboration with Daniel Neumark’s group (University of California, Berkeley) and with Mark Johnson’s group (Yale University, New Haven). I gratefully thank them and the members of their groups, in particular Jia Zhou and Jeffrey Headrick.

I was introduced to lasers and optics by Aiguo Cui, Donatas Podėnas, and especially by Marcel Krenz, and went on learning from them over the years. I am very grateful to them all.

Many people from the institute contributed on a more personal level to make the time I spent there a wonderful part of my life. I must make special mention of Micol Alemani, Dr. Knuto, Mathias Brünner, Markus Gühr, Ewald Janssens, Michael Kregielski, Marcel Krenz, Luca Lelli, Cosmin Lupulescu, Brigitte Odeh, Andrea Merli, Aldo Mirabal, Bruno Schmidt, Torsten and Liana Siebert, Carsten Urbach, Stefan Vajda, Stefan Weber. I spent many months in the basement of the FOM Institute. It is amazing how scientists are so generously distributed in the world that even in that damp place I could meet such nice people as Joost Bakker, Giel Berden, René van Buuren, Peter Delmee, André Fielicke, Daniel Goebbert, Wim Mastop, Dave Moore, Jos Omens, Britta Redlich, Theo Ram, Boris Sartakov, Rob Satink, Lex van der Meer, Deniz van Heijnsbergen, Gert von Helden.

I gratefully acknowledge the German Research Foundation DFG that supported my work as part of the *Dedicated Research Center SFB-546 "Structure, Dynamics, and Reactivity of Transition Metal Oxide Aggregates"*.

Infine ringrazio la mia Miriam, che rende la mia vita serena e felice.
