1 Directory ........................................................................................................................................1

2 Introduction .....................................................................................................................................2

3 Materials and methods ..................................................................................................................3

3.1 Determination of soil parameters ...........................................................................................3
  3.1.1 Water content ...................................................................................................................3
  3.1.2 Maximum water holding capacity (MWC) ...................................................................3
  3.1.3 Soil acidity .......................................................................................................................3
  3.1.4 Content of organic matter and organic carbon ..............................................................4
  3.1.5 Grain size ........................................................................................................................4

3.2 Test organisms ..........................................................................................................................4

3.3 Tests .........................................................................................................................................5
  3.3.1 Soil tests ........................................................................................................................5
  3.3.2 Non-soil tests ..................................................................................................................8
  3.3.3 Statistics .........................................................................................................................9

4 Pure substances ..........................................................................................................................11

4.1 Abstract ....................................................................................................................................11

4.2 Theoretical background ..........................................................................................................11
  4.2.1 TNT .............................................................................................................................12
  4.2.2 Hexyl ............................................................................................................................14
  4.2.3 Hexogen (RDX) ...........................................................................................................15
  4.2.4 Octogen (HMX) ..........................................................................................................16
  4.2.5 Triaminotoluene (TAT) ..............................................................................................17

4.3 Materials and methods ............................................................................................................18
  4.3.1 Contaminants ................................................................................................................18
  4.3.2 Tests .............................................................................................................................19

4.4 Results .....................................................................................................................................20
  4.4.1 TNT .............................................................................................................................20
5.5 Discussion .................................................................................................................... 66
5.5.1 Comparison of uncontaminated reference soil materials................................. 66
5.5.2 Comparison of the toxicity of TNT in the reference soil materials.................. 68

6 Ageing of TNT-contaminated soil materials ............................................................... 71
6.1 Abstract....................................................................................................................... 71
6.2 Theoretical background .......................................................................................... 71
  6.2.1 Sorption ............................................................................................................... 72
  6.2.2 Microbial degradation of TNT .......................................................................... 72
6.3 Materials and methods ......................................................................................... 74
  6.3.1 Ageing at different temperatures ...................................................................... 74
6.4 Results .................................................................................................................... 75
  6.4.1 Ageing at different temperatures ...................................................................... 75
  6.4.2 More detailed assessment of ageing at 20°C ..................................................... 82
  6.4.3 Summary of results ......................................................................................... 85
6.5 Discussion ................................................................................................................ 86
  6.5.1 Ageing at different temperatures ...................................................................... 86
  6.5.2 More detailed assessment of ageing at 20°C ..................................................... 90

7 Contaminated soil materials .................................................................................. 92
7.1 Abstract....................................................................................................................... 92
7.2 Theoretical background .......................................................................................... 92
  7.2.1 “Werk Tanne” Clausthal-Zellerfeld .................................................................. 93
  7.2.2 Elsnig near Torgau .......................................................................................... 94
  7.2.3 Hambühren ...................................................................................................... 94
  7.2.4 Stadtallendorf .................................................................................................. 94
7.3 Materials and methods ........................................................................................... 95
  7.3.1 Properties of the soil materials ........................................................................ 95
  7.3.2 Analysis of contaminated soil samples ............................................................. 95
  7.3.3 Evaluation of the toxicity of heavy metals in the contaminated soil materials .... 96
7.4 Results .................................................................................................................... 98
  7.4.1 „Werk Tanne“ Clausthal-Zellerfeld ................................................................. 98
List of figures

Fig. 4.2-1: Structural formula of TNT ................................................................. 12
Fig. 4.2-2: Structural formula of Hexyl ............................................................... 14
Fig. 4.2-3: Structural formula of Hexogen .......................................................... 15
Fig. 4.2-4: Structural formula of Octogen .......................................................... 16
Fig. 4.2-5: Structural formula of TAT ................................................................. 17
Fig. 4.4-1: Concentration-effect relationship for TNT in standard soil material Lufa 2.2 ...... 20
Fig. 4.4-2: Surviving E. crypticus of a mortality test with various concentrations of TNT-contaminated soil materials ................................................................. 20
Fig. 4.4-3: Cocoon rates for E. crypticus transferred from different concentrations of TNT-contaminated soil materials onto agar-agar ................................................. 22
Fig. 4.4-4:: Hatching rates for the cocoons laid 1-3 days after the transfer of the adult E crypticus from TNT-contaminated soil materials ..................................................... 23
Fig. 4.4-5: Concentration-effect relationship for TNT in the contact test with F. candida and in the water test with E. crypticus ................................................................. 23
Fig. 4.4-6: Distribution of E. crypticus in a separated test set of a choice test with TNT ...... 26
Fig. 4.4-7: Distribution of E. crypticus in a separated test set of a choice test with TNT after 7 days of ageing ................................................................. 27
Fig. 4.4-8: Concentration-effect relationship with Hexyl for F. candida and E. crypticus. The data for mortality and reproduction are given in relation to the values in the standard soil material Lufa 2.2 ......................................................... 28
Fig. 4.4-9: Reproduction rates of F. candida transferred from a mortality test in various Hexyl-contaminated soil materials into uncontaminated soil material .................. 29
Fig. 4.4-10: Photos of surviving E. crypticus from a mortality test in various concentrations of Hexyl-contaminated soil materials ......................................................... 30
Fig. 4.4-11: Cocoons laid by worms out of the control and cocoons laid by worms out of Hexyl-contaminated soil material immediately after the transfer .............................. 30
Fig. 4.4-12: Cocoon rates for E. crypticus transferred from different concentrations of Hexyl-contaminated soil materials onto agar-agar ............................................... 31
Fig. 4.4-13: Hatching rates of cocoons laid 1-3 days after the transfer of adult E. crypticus from various Hexyl-contaminated soil materials onto agar-agar ......................... 32
Fig. 4.4-14: Hatching rate of cocoons laid 4-6 days after the transfer of adult E. crypticus from various Hexyl-contaminated soil materials onto agar-agar ......................... 33
Fig. 4.4-15: Hatching rates of cocoons laid 7-9 days after the transfer of adult *E. crypticus* from various Hexyl-contaminated soil materials onto agar-agar ........................................ 34

Fig. 4.4-16: Distribution of *F. candida* in a separated test set of a choice test with Hexyl ...... 35

Fig. 4.4-17: Distribution of *E. crypticus* in a separated test set of a choice test with Hexyl. .... 36

Fig. 4.4-18: Concentration-effect relationship for TAT with *F. candida* and *E. crypticus* .......... 40

Fig. 4.4-19: Concentration-effect relationship for TAT in the water tests with *F. candida* and *E. crypticus* ............................................................................................................ 40

Fig. 4.4-20: Distribution of *E. crypticus* in a separated test set of a choice test with TAT....... 42

Fig. 5.3-1: Distribution of grain size in the Lufa soil materials ............................................... 61

Fig. 5.3-2: Content of organic carbon in the reference soil materials ..................................... 61

Fig. 5.4-1: Mortality and reproduction rate in different reference soil materials for *F. candida* and *E. crypticus* .................................................................................................. 63

Fig. 5.4-2: Concentration-effect relationship for TNT in the reference soil material Lufa 2.3 with *F. candida* and *E. crypticus* ............................................................................. 63

Fig. 5.4-3: Concentration-effect relationship for TNT in the reference soil material Lufa 3 with *F. candida* and *E. crypticus* ................................................................................ 64

Fig. 5.4-4: Concentration-effect relationship for TNT in the reference soil material Lufa 4 with *F. candida* and *E. crypticus* ................................................................................ 64

Fig. 5.4-5: Concentration-effect relationship for TNT in the potting soil with *F. candida* and *E. crypticus* .......................................................................................................... 65

Fig. 5.4-6: LC50(7d)- and EC50(28d)-values in the different reference soil materials with *F. candida* and *E. crypticus* .......................................................................................... 66

Fig. 6.2-1: Possible intermediates and condensation products of TNT originating from gratuitous reduction .................................................................................................................. 73

Fig. 6.4-1: Reproduction rates for *F. candida* in soil materials aged at different temperatures for the two lowest tested concentrations ......................................................... 79

Fig. 6.4-2: LC50(7d)-values for *F. candida* in TNT-contaminated soil materials aged at 4°C and 20°C in comparison to unaged soil material indicated by the line. ............... 80

Fig. 6.4-3: Reproduction rates for *F. candida* in TNT-contaminated soil materials aged at different temperatures for the two lowest tested concentrations. .................. 82

Fig. 6.4-4: Mortality and reproduction rates for *F. candida* in TNT-contaminated soil materials aged at 20°C ........................................................................................................... 84

Fig. 6.4-5: LC50(7d)- and EC50(28d)-values for *F. candida* in TNT-contaminated soil materials aged at 20°C ........................................................................................................... 85
Fig. 7.4-1: Concentration-effect relationship with CTNT1a in dilution with the standard soil material Lufa 2.2 for *F. candida* and *E. crypticus* ............................................................. 98

Fig. 7.4-2: Concentration-effect relationship with CTNT2a in dilution with the standard soil material Lufa 2.2 for *F. candida* and *E. crypticus* ........................................ 99

Fig. 7.4-3: Concentration-effect relationship with CTNT4a in dilution with the standard soil material Lufa 2.2 for *F. candida* and *E. crypticus* ....................................... 100

Fig. 7.4-4: Concentration-effect relationship with ETNTa in dilution with the standard soil material Lufa 2.2 for *F. candida* and *E. crypticus* ........................................... 102

Fig. 7.4-5: Concentration-effect relationship with LTNT1a for *F. candida* and *E. crypticus* ........................................ 103

Fig. 7.4-6: LC50(7d)- and EC50(28d)-values for the TNT-contaminated soil materials in dilution with Lufa 2.2 for *F. candida* and *E. crypticus*. ........................................ 104

Fig. 8.2-1: Flow chart of a soil washing process by the AB Umwelttechnik GmbH .......... 115

Fig. 8.2-2: Microbial reduction of TNT ............................................................................. 117

Fig. 8.4-1: Mortality and reproduction rates of *F. candida* and *E. crypticus* in the contaminated soil material CTNT2a and the remediated soil material CTNT2aVA from the ammunition plant “Werk Tanne” at Clausthal-Zellerfeld (Lower Saxony, Germany) ........................................................................................................ 124

Fig. 8.4-2: Mortality and reproduction rates of *F. candida* and *E. crypticus* in the contaminated soil material CTNT2a and the remediated soil material CTNT3b from the ammunition plant “Werk Tanne” at Clausthal-Zellerfeld (Lower Saxony, Germany) ........................................................................................................ 125

Fig. 8.4-3: Mortality and reproduction rates of *F. candida* and *E. crypticus* in the contaminated soil material CTNT4a and the remediated soil materials CTNT4b, CTNT7b as well as in the uncontaminated soil material CTNT04a before and after the remediation (CTNT04b) from the munition plant “Werk Tanne” (Lower Saxony, Germany) ........................................................................................................ 126

Fig. 8.4-4: Mortality and reproduction rates of the original soil material LTNTa from Hambühren (Lower Saxony, Germany) and the two soil fractions LTNT1b and LTNT1c after the washing process in the stationary soil washing plant of the ABU at Lägersdorf ........................................................................................................ 128

Fig. 8.4-5: Concentration-effect relationship with LTNT1b for *F. candida* and *E. crypticus* ........................................ 129
List of tables

Table 3.3-1: Overview of the used statistical tests ................................................................. 9
Table 3.3-2: Overview of the biotest-systems with *E. crypticus* and *F. candida* ............ 10
Table 4.3-1: Properties of explosives .................................................................................... 18
Table 4.4-1: Cocoon rates for *E. crypticus* transferred from different concentrations of TNT-contaminated soil materials onto agar-agar ............................................. 21
Table 4.4-2: Hatching rates for the cocoons laid 1-3 days after the transfer of adult *E. crypticus* from different concentrations of TNT-contaminated soil materials .......... 22
Table 4.4-3: LC 50 values of TNT for *F. candida* in the contact test and *E. crypticus* in the water test after 24, 48 and 72 hours ................................................................. 24
Table 4.4-4: Distribution of *F. candida* in a separated test set with TNT ......................... 25
Table 4.4-5: Distribution of *E. crypticus* in a separated test set with TNT ....................... 25
Table 4.4-6: Distribution of *E. crypticus* in a separated test set with TNT after an ageing period of 7 days ........................................................................................................ 26
Table 4.4-7: Mortality for *F. candida* with Hexyl ................................................................. 28
Table 4.4-8: Number of adults transferred from the Hexyl-contaminated soil materials onto the uncontaminated soil material, number of adults found after a test period of three weeks and the reproduction rate after 3 weeks .............................................. 29
Table 4.4-9: Cocoon rate for *E. crypticus* transferred from different concentrations of Hexyl-contaminated soil materials onto agar-agar ................................................. 31
Table 4.4-10: Hatching rates for the cocoons laid 1-3 days after the transfer of adult *E. crypticus* from different concentrations of Hexyl-contaminated soil materials ................................................................. 32
Table 4.4-11: Hatching rates for the cocoons laid 4-6 days after the transfer of adult *E crypticus* from different concentrations of Hexyl-contaminated soil materials ........................................................................................................ 33
Table 4.4-12: Hatching rates for the cocoons laid 7-9 days after the transfer of adult *E. crypticus* from different concentrations of Hexyl-contaminated soil materials ........................................................................................................ 33
