

Acknowledgements

Finally, I would like to say many thanks to all people who helped me and gave their support during the last five years of my life.

First of all I would like to thank my supervisor Prof. I. V. Hertel for the opportunity to make this work within his group at the Max-Born-Institute. His enthusiasm and helpful suggestions increased my motivation of going even deeper into the essence of my work.

I am also indebted to Prof. L. Wöste for accepting to be my second supervisor, his interest to this work, and providing the opportunity to present the obtained results at his group seminar.

I am very grateful to Dr. C. P. Schulz and Dr. T. Laarmann for being the direct supervisors, their guidance and knowledge, answering not only scientific questions but also multiple personal questions, and of course for their suggestions, criticism, and corrections to improve the text of this thesis.

I would especially like to thank Dr. N. Zhavoronkov for opening me the door to the laser world and for the help with the experimental equipment.

I also thank Dr. G. Steinmeyer and Dr. G. Stibenz for the organisation of sub-10 fs experiments.

Many thanks to all my colleagues from Department A2, both past and present, for the support and cooperation. I sincerely acknowledge my office colleagues Pushkar Singh and Yuliya Rulyk for the pleasant working atmosphere; Mr. A. Hentschel for his help with computers and electronics; Mrs. H. Gromilovich for her help with administrative duties; Mrs. S. Winter, Mrs. K. Damm, and Mr. B. Kinski for their help on all bureaucratic and personal aspects of my work.

I am happy to thank my friends in Germany and abroad for their friendship, loyalty, and staying with me when I have needed them.

Lastly special thanks to my whole family: my wife Alena, daughter Zlata, parents, grand-

mothers, and brother for their love, support throughout the years, and help me to achieve my goals. In memory of grandfathers who will always be in my heart.

This work has been financially supported by the German Science Foundation (DFG) via the collaborative research centre 450 "Analysis and Control of Ultrafast Photoinduced Reactions", project A2.
