

# List of Tables

2.1	Central wavelengths $\lambda$ , full widths at half maximum $\delta\lambda$ and primary use of the MERIS spectral channels . . . . .	4
2.2	Central wavelengths $\lambda$ , full widths at half maximum $\delta\lambda$ and primary use of the MODIS spectral channels . . . . .	6
2.3	Relationships between integrated optical depth scaling factors. Values in the first row (1) are from [6], values in the second row (2) are from this work. . . . .	13
2.4	Signal-to-noise ratios of the different MERIS and MODIS water vapour absorption and window channels used for the estimation of retrieval error due to sensor noise. . . . .	17
2.5	Root mean square errors of retrieved columnar water vapour above land from simulated radiances. For details, see text. . . . .	19
3.1	FTP transfer statistics for the Dundee Satellite receiving station and the DLR-DFD in Oberpfaffenhofen for the period January to August 2003. (The number in brackets are for the two central overpasses only) . . . . .	32
4.1	Summary of validation results for the satellite-based retrieval of atmospheric water vapour. # denotes the number of collocations, rmsd the <i>rms</i> deviation of differences, $\langle \rangle$ the averaged value from the validation data. All water vapour values are given in mm. In the second table, the statistics are calculated after a $2\sigma$ elimination, i.e. after the removal of absolute differences larger than twice the standard deviation. . . . .	44

5.1 Biases and root mean square deviations (rmsd) from all MODIS  
validations and comparisons presented in this work. . . . . 61
