Zusammenfassung **5**

Abstract **7**

1 Introduction **11**

2 Theory **19**

2.1 Optimal control of quantum systems over finite time interval 19

2.1.1 The Lagrangian formalism 19

2.1.2 Derivation of the differential equation for the optimal control field 22

2.1.3 An approximate analytical solution for the case of a two level system 24

2.1.4 The analytical solution for the optimal control field with a simplified Lagrangian 25

2.1.5 Optimal control at a given time 27

2.1.6 Estimation of the absolute bound for the control due to relaxation and dephasing effects 28

2.2 Calculation of the excitation spectrum of quantum systems using genetic algorithms 30

2.2.1 Introduction to evolutionary algorithms 30

2.2.2 Definition of the representation, fitness and genetic operators for quantum ground-state problem 33

2.2.3 Extension of the QGA for the solution of quantum statistical problems 38

2.3 Photon assisted tunneling between quantum dots: optimal control approach 41

2.3.1 Equations of motion in terms of density matrix . . 41

2.3.2 The control problem 43

2.4 Explosion of noble gas clusters in strong laser fields 46

2.4.1 Time and length scales for the cluster explosion . . 46

2.4.2 Explosion scenario 48

2.4.3 Equations of motion 50

2.4.4 Integration of the equations of motion: the split operator method 52

3 Results **55**
3.1 Optimal control of a time averaged occupation of the excited level in a two-level system 56
3.1.1 The influence of relaxation on the optimal control . 56
3.1.2 Optimal control field calculated using a simplified Lagrangian 60
3.2 Application of the QGA to the eigenstate problem for interacting electrons in quantum dots 63
3.2.1 The ground state problem in one and two dimensions 63
3.2.2 Formation of a "Wigner molecule" and its "melting" 70
3.3 Optimal field for control of the photon assisted tunneling between quantum dots 75
3.3.1 Numerical solution using the genetic algorithm: the influence of relaxation on the optimal control 75
3.4 Explosion of Xe_N clusters 83
3.4.1 Ionization and explosion dynamics 83
3.4.2 Dependence of the kinetic energy distribution on the cluster size 85
3.4.3 Isotropic inhomogeneous 3D Coulomb model 89

4 Conclusions and outlook **91**

A The adiabatic approximation **97**

B Derivation of an approximate solution for a two level system **99**

C Generalization of the QGA for higher dimensions **101**

D Integration of the pendulum equation **103**
