 Crossbreeds=0.05  
 Comment 1= trypanotolerance, 0.5 =trypanosusceptible

### **Equations in tsetse**

Compartment Infected fly  
 Initial value = 50  
 Rate of change = + infection of fly + extra – death

Compartment Susceptible fly  
 Initial value = 4851  
 Rate of change = +growth – death - infection of fly – extra death from VC

Flow → extra death  
 Extra death = vector control \* susceptible fly

Flow → death  
 Death = if susceptible fly < 4851 the susceptible fly/6000 else )  
 Comment density dependent death

Flow → extra death  
 Extra death= vector control \* infected fly

Flow → infection of fly  
 Infection of fly = susceptible fly \* diseased host\* 0.02\*0.0005/365 + susceptible fly \*  
 infected host\* 0.02\*0.0005/365  
 Comments transmission from infected host to vector estimates 0.025 to 0,177

Variable Vector Control  
 Vector control =0

### **Equations in alternative hosts**

Compartment Infected  
 Initial value = 1000  
 Rate of change = + infection – exit

Compartment Susceptible  
 Initial value=1000  
 Rate of change = + entry – infection  
 Comments assumes steady state population of alternative hosts

Flow → entry  
 Entry = Susceptible host \* infected fly \*0.02/365  
 Comments transmission from infected host to vector estimates 0.025 to 0,177

Flow → exit  
 Exit = Infected alt host \* infected fly\* 2/100/365

Flow → infection  
 Infection = Susceptible infected host \* infected fly \*0.02/365

## Annex 2: Cost benefit analyses

All strategies are based on the average village of 26 farmers and 426 cattle. Assumptions and costs are as follows:

### **Intervention one: Participatory vector control**

Table 1: Year one costs for participatory vector control in four villages

|                              | <b>Unit</b> | <b>Cost per unit \$</b> | <b>No. units</b> | <b>Total cost</b> |      |
|------------------------------|-------------|-------------------------|------------------|-------------------|------|
| Costs of running project     | village     | 1038                    | 1                | 1038              |      |
| Cost of screens              | screen      | 2                       | 60               | 120               |      |
| Insecticide to treat screens | litre       | 18                      | 3                | 54                |      |
| Additional sprays for cattle | cow treated | 0.08                    | 1922             | 154               |      |
| Time needed by farmers       | farmer day  | 2                       | 364              | 728               | 2094 |

- The costs of running the project are the actual costs of the vector control project in Burkina Faso. The costs of screens and insecticides are market prices.
- The cost of insecticide treatment of cattle is based on the findings of the project. Farmers give six additional treatments per cow, and treat 75% of the village herd (427 cattle, the average herd size for the three study sites).
- There are 26 households per village (average for the 3 study sites) and each household spends ten days on project set-up activities, two days on additional spraying of cattle and two days on placing, checking and removing screens of two weeks in total per household. The price is that of a days labour in the study area

Table 2: Running costs for Participatory Vector Control in four villages

|                   | <b>Unit</b> | <b>Cost per unit (\$)</b> | <b>No. units</b> | <b>Total cost (\$)</b> |     |
|-------------------|-------------|---------------------------|------------------|------------------------|-----|
| Insecticide       | litre       | 18                        | 3                | 54                     |     |
| Replace screens   | screen      | 2                         | 6                | 12                     |     |
| Additional sprays | cow treated | 0.08                      | 1922             | 154                    |     |
| Time              | farmer day  | 2                         | 104              | 208                    | 428 |

- It is assumed that 10% of screens need replacement each year
- Each household gives 4 days per year for spraying and screen placement.

### Year 1- 10: Benefits

The average value of a bovine was calculated from the population structure available for Burkina Faso and Sikasso and price data from Burkina Faso.

Table 3; Herd structure for villages in Burkina Faso and Mali

| <b>Category</b> | <b>Number</b> | <b>Range of prices</b> | <b>Assumed Value</b> | <b>Value cattle</b> |
|-----------------|---------------|------------------------|----------------------|---------------------|
| Adult M         | 1035          | 70 000-125 000         | 70 000               | 72 450 000          |
| Adult F         | 816           | 50 000- 80 000         | 50 000               | 40 800 000          |
| <4 years        | 1268          | 20 000- 40 000         | 20 000               | 2 536 000           |

The lowest value was taken as a conservative value because prices in Burkina Faso are higher than in Mali and Guinea From this the average value of a bovine was 37122.8 CFCA, or \$74 using the exchange rate of 2002.

The annual mortality rate in the three study sites is 0.06%. The average village has 427 cattle. In villages with vector control in Burkina Faso the mortality was 0.293 of that without vector control. It is assumed that this level of benefit can be extrapolated to the rest of the study area.

This is reasonable as this level of benefit was reported from other vector control projects in other areas.

Annual losses for a village without VC

$$\begin{aligned} &= \text{price bovine} \times \text{mortality rate} \times \text{number of cattle in village} \\ &= \$74 \times 0.06 \times 427 = \$1896 \end{aligned}$$

Annual losses for a village with VC

$$= \$74 \times 0.06 \times 0.293 \times 427 = \$555$$

Difference = 1340 = Annual benefits of vector control

It is assumed that in the first year benefits are 50% of in the other years; vector control usually takes 6-9 months to be effective.

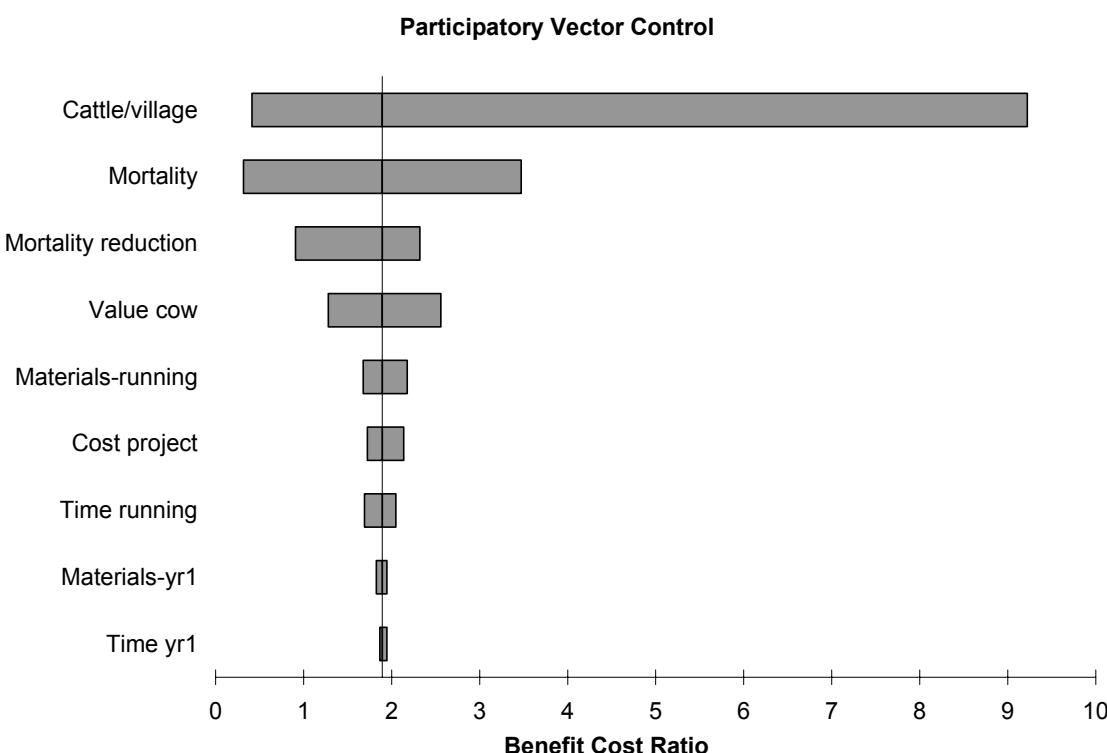

Sensitivity analysis was used to take into account a) the range of different scenarios in the study area, b) the accuracy of estimates (based on upper and lower confidence limits) and c) possible variations in prices of important inputs and outputs.

Table 4: Range of values for sensitivity analysis of participatory vector control

|                     | <b>Best estimate</b> | <b>Low estimate</b> | <b>High estimate</b> | <b>Source of uncertainty</b> |
|---------------------|----------------------|---------------------|----------------------|------------------------------|
| Cost project        | 1038                 | 500                 | 1500                 | Possible change in price     |
| Materials-year 1    | 328                  | 200                 | 500                  | Possible change in price     |
| Time costs – year 1 | 728                  | 600                 | 800                  | Possible change in price     |
| Materials-running   | 220                  | 120                 | 320                  | Possible change in price     |
| Time costs- running | 208                  | 150                 | 300                  | Possible change in price     |
| Value cow           | 74                   | 50                  | 100                  | Range in project area        |
| Mortality           | 0.06                 | 0.01                | 0.11                 | Range in project area        |
| Mortality reduction | 0.29                 | 0.13                | 0.66                 | Confidence interval          |
| Cattle/village      | 427                  | 93                  | 2080                 | Range in project area        |

At low levels of mortality, or cattle per village participatory vector control did not break even. The estimates of the effectiveness of VC were sufficiently precise to be confident that VC would have a Benefit to cost ratio greater than one.

Figure 1 Sensitivity analysis for Participatory vector control

## Intervention two: Trypanotolerant cattle

Year one losses: Start up

Decline in value of herd

$$\begin{aligned} &= \text{number of cattle in village} \times \text{price of bovine} \times \text{differential in price when trypanotolerant} \\ &= 427 \times \$74 \times 0.2 = 6320 \text{ USD} \end{aligned}$$

The price differential between trypanotolerant and trypanosusceptible cattle is 10-30% (Kamuanga et al, 2001).

Year 1-10 costs: None

Year 1- 10 benefits

In herds with only trypanosusceptible the annual mortality was 0.109 while in herds with only trypanotolerant cattle the mortality was 0.024.

Annual losses assuming that all village cattle are trypanosusceptible

$$\begin{aligned} &= \text{price trypanotolerant} \times \text{mortality rate} \times \text{number of cattle in village} \\ &= \$74 \times 0.109 \times 427 = \$3444 \end{aligned}$$

Annual losses assuming all the village herd is trypanotolerant

$$= \$74 \times 0.8 \times 0.024 \times 427 = \$607$$

Difference =  $3444 - 607 = 2838$  = annual benefits of trypanotolerant cattle

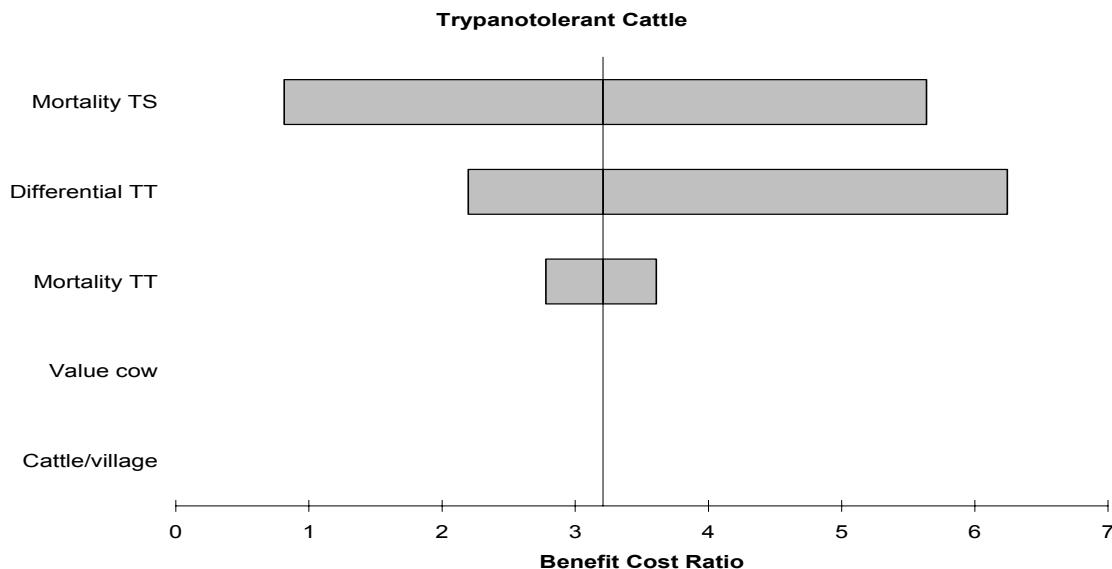

Table 5: Range of values for sensitivity analysis of the strategy of keeping trypanotolerant cattle

|                 | Best Estimate | Low Estimate | High Estimate | Source of Estimates |
|-----------------|---------------|--------------|---------------|---------------------|
| Value cow       | \$74          | \$50         | \$100         | Range in study area |
| Mortality TS    | 0.109         | 0.042        | 0.177         | Confidence interval |
| Mortality TT    | 0.024         | 0.01         | 0.039         | Confidence interval |
| Cattle/village  | 427           | 93           | 2080          | Range in study area |
| Differential TT | 0.2           | 0.1          | 0.3           | Range               |

\* Percentage difference in price between trypanotolerant and trypanosusceptible cattle

When the mortality rate in trypanosusceptible cattle was low, the intervention was not cost effective.

Figure 2 Sensitivity analysis for strategy of trypanotolerant cattle

### **Intervention three : a) Provision of Rational Drug Use information to farmers**

Year 0: Start up costs

Development of information 5000 USD for 50 villages = 100 USD per village

Year 1- 10: Running costs

(Cost of brochure + cost of distribution) x number of farmers =  $0.22 \times 26 = 6$

Year 0 to 10: Benefits

In the three study areas the loss from AAT is on average 0.9 animals per herd.

Farmers who get RDU information have a 20% less chance of experiencing mortality.

Annual losses without RDU

=farmers X average deaths per herd X value bovine

$$= 26 \times 0.9 \times 74 = 1732$$

Annual losses with RDU

= farmers X reduction in chance of mortality X average deaths/herd X value bovine

$$= 26 \times 0.81 \times 0.9 \times 74 = 1402$$

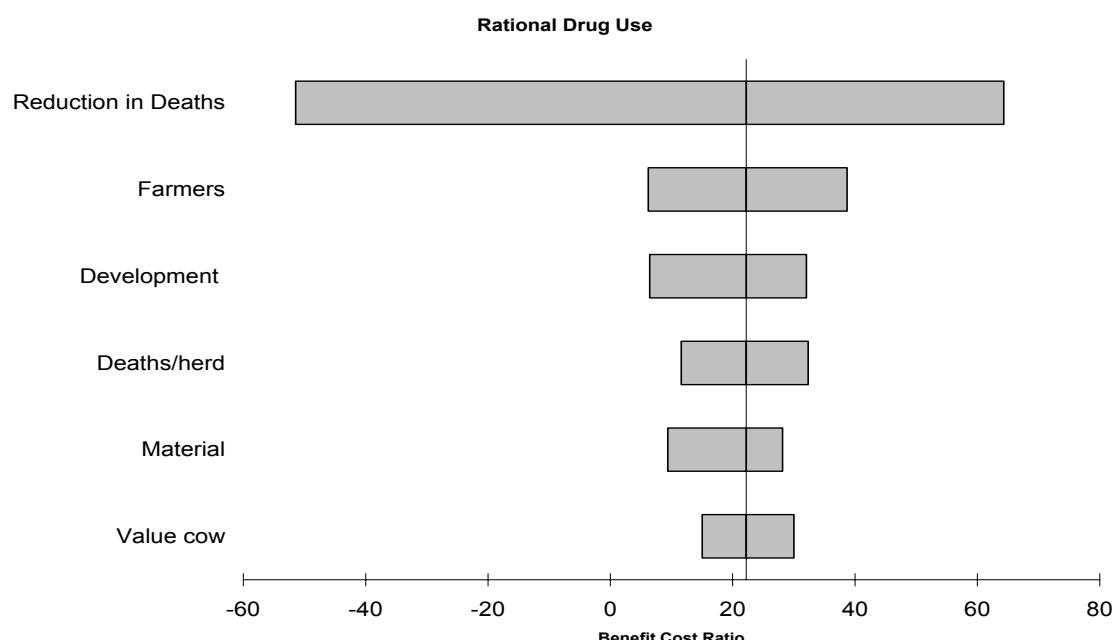

Difference = 329 = annual benefits of RDU

Table 6 Range of values for sensitivity analysis of RDU provision

|                  | <b>Best estimate</b> | <b>Low estimate</b> | <b>High estimate</b> | <b>Source of Estimates</b> |
|------------------|----------------------|---------------------|----------------------|----------------------------|
| Development      | \$100                | \$50                | \$500                | Possible range in price    |
| Material         | 0.22                 | 0.1                 | 1                    | Possible range             |
| Farmers          | 26                   | 5                   | 85                   | Range in study area        |
| Deaths/herd      | 0.9                  | 0.47                | 1.31                 | Confidence interval        |
| Reduction Deaths | 0.81                 | 0.45                | 1.44                 | Confidence interval        |
| Value cow        | 74                   | 50                  | 100                  | Range in study area        |

The intervention had an attractive benefit to cost ratio over all the conditions in the study area. However, because of the short follow-up period, the estimates of the impact of the intervention on mortality were very imprecise.

Figure 3 Sensitivity analysis for RDU provision

### **Intervention three : b) Establishing primary animal health care**

Year 0: Start up costs

Table 7 Costs of training paravets (one week) for four villages

| Item                 | Units | Unit cost FCFA | Total cost FCFA | Total cost USD |
|----------------------|-------|----------------|-----------------|----------------|
| Staff per diems      | 12    | 5,000          | 60,000          | 100            |
| Room for class       | 3     | 1,000          | 3,000           | 5              |
| Day lodging and food | 192   | 2,000          | 439,000         | 631            |
| Material             | 24    | 900            | 21,600          | 36             |
| Kit                  | 24    | 2,500          | 60,000          | 100            |
|                      |       | Total          | 583,600         | 973            |

Costs of training paravets are \$243 per village

Year 1-10 Running costs

Costs of refreshing training 1-2 days \$100 per village

Year 1-10 Benefits

Among farmers using paravets there was a reduction in 2.3% per year

Annual losses for a village without paravets

$$\begin{aligned} &= \text{price bovine} \times \text{mortality rate} \times \text{number of cattle in village} \\ &= \$74 \times 0.06 \times 427 = \$1896 \end{aligned}$$

Annual losses for a village with paravets

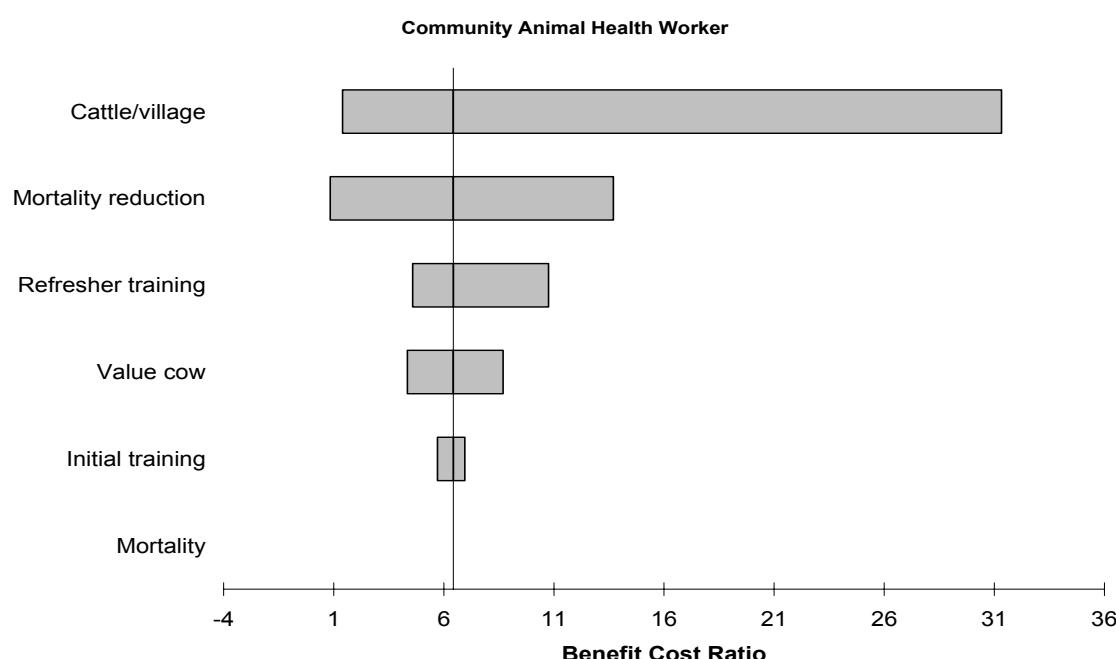

$$= \$74 \times (0.06 - 0.023) \times 427 = \$1169$$

Difference = 727 = Annual benefits of vector paravet

Table 8 Range of values for sensitivity testing of training paravet strategy

|                     | Best estimate | Low estimate | High estimate | Source of Estimates      |
|---------------------|---------------|--------------|---------------|--------------------------|
| Initial training    | \$243         | \$150        | \$400         | Range of possible prices |
| Refresher training  | 100           | 50           | 150           | Range of possible prices |

| Cattle/village      | 427           | 93           | 2080          | Range in study area      |

Figure 3: Sensitivity analysis for paravet training

### Intervention three: c)Training existing service providers

Year 0: Start up costs

Table 9 Costs of training service providers (two days); 48 service providers were trained delivering services to 235 villages

|                    | Guinea Francs | FCFA   | US\$ |
|--------------------|---------------|--------|------|
| Perdiems           | 960000        | 240000 | 436  |
| Accommodation      | 2160000       | 540000 | 982  |
| Food               | 60000         | 15000  | 27   |
| Materials          | 510000        | 120000 | 218  |
| Attendance         | 1000000       | 250000 | 455  |
| Workshop           | 2000000       | 500000 | 909  |
| Extension material | 240000        | 60000  | 109  |

Costs of training paravets are \$3136 in total or \$13 per village

Year 1-10 Running costs

We assume the workshop is repeated every year, at the same cost

Year 1-10 Benefits

We make a conservative assumption that the decline in mortality was 1% per year. Training paravets was associated with a reduction of 2.3% in mortality.

Annual losses for a village without service provider training

$$\begin{aligned} &= \text{price bovine} \times \text{mortality rate} \times \text{number of cattle in village} \\ &= \$74 \times 0.06 \times 427 = \$1896 \end{aligned}$$

Annual losses for a village with trained service providers

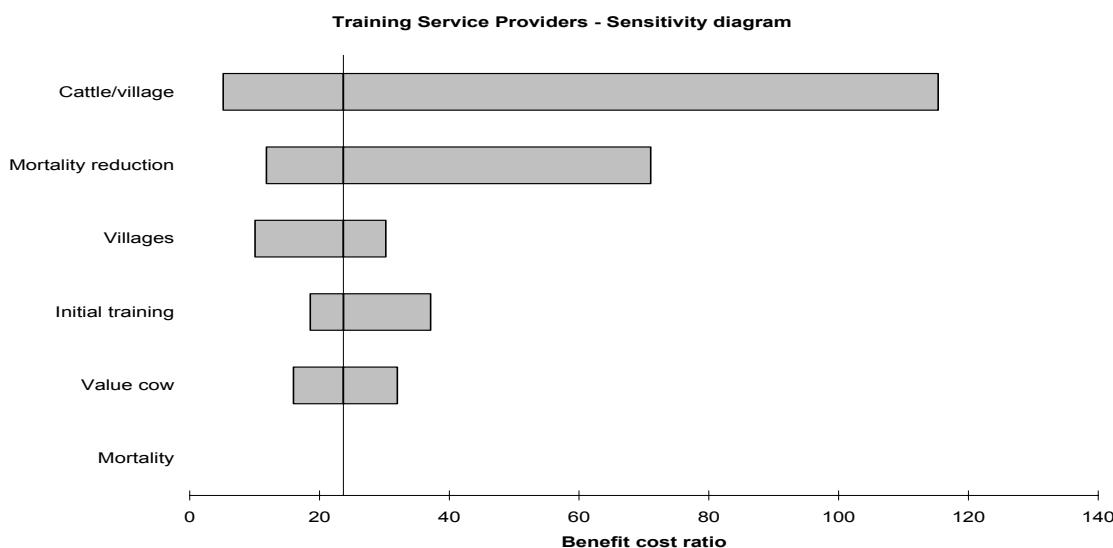

$$= \$74 \times (0.06 - 0.01) \times 427 = \$1169$$

Difference = 727 = Annual benefits of vector control

Table 10 Range of values for sensitivity testing of training service provider strategy

|                     | Best estimate | Low estimate | High estimate | Source of Estimates      |
|---------------------|---------------|--------------|---------------|--------------------------|
| Initial training    | \$3136        | \$2000       | \$4000        | Range of possible prices |

| Jours de<br>participation |                                       |          |           |         |         |          |   |         |                        |           |                      |                          |                         |
| Cotisation                |                                       |          |           |         |         |          |   |         |                        |           |                      |                          |                         |

1.3- Combien de vélos et de mobylettes/Motos, voitures et autres biens dispose l'exploitation ?

| Vélos | Mobylettes/Motos | Voiture |
|-------|------------------|---------|
|       |                  |         |

1.4- Autres indicateurs de bien être

Maison en ciment \_\_\_\_ / En terre battue \_\_\_\_ / Toit en tôles \_\_\_\_ / Toit en pailles \_\_\_\_  
 Charrue \_\_\_\_ / Charrettes \_\_\_\_ / Semoirs \_\_\_\_ /  
 Radio \_\_\_\_ / Télévision \_\_\_\_ /

### 2- Production Animale

2.1- Composition du troupeau de bovins

| Catégories                  | Zebu | Metis | Baoule | Boeufs de labour |
|-----------------------------|------|-------|--------|------------------|
| Veaux et velles de 0 à 1 an |      |       |        |                  |
| Mâle entier > à 1 an        |      |       |        |                  |
| Mâle castré > à 1 an        |      |       |        |                  |
| Génisses                    |      |       |        |                  |
| Vaches                      |      |       |        |                  |

2.2 Quel est le rôle des bovins dans l'exploitation? (Par ordre d'importance)

| Rôle                 | Réponse | Ordre | Réponse                  | Ordre |
|----------------------|---------|-------|--------------------------|-------|
| Production de viande |         |       | Pour la traction animale |       |
| Production de lait   |         |       | Cérémonie                |       |
| Production de fumier |         |       | Autres spécifiez         |       |
| Epargne / assurance  |         |       |                          |       |
| Pour la vente        |         |       |                          |       |

2.3- Quelles sont les raisons de choix de la race la plus importante dans le troupeau

- 1.....
- 2.....
- 3.....

**2.4- Qui a la responsabilité au niveau du ménage pour:**

|  |  |
|--|--|
| Décider du lieu de pâture                |  |
| Décider du lieu d'abreuvement            |  |
| Décider du traitement d'un animal malade |  |
| L'achat des médicaments                  |  |
| Administrer les médicaments              |  |

**3- Alimentation et abreuvement des animaux**

3.1- Utilisez-vous des compléments d'alimentation? Oui      ou      Non      Si oui lesquels?

|   | Réponses | Quand?<br>(saison) | Combien de fois par<br>semaine? |
|---|----------|--------------------|---------------------------------|
| Sels  |          |                    |                                 |
| Fourrages cultivés                                  |          |                    |                                 |
| Feuilles / et autres produits de la brousse         |          |                    |                                 |
| Résidus de transformation des produits<br>agricoles |          |                    |                                 |
| Les résidus de récolte                              |          |                    |                                 |

3.2- Aviez-vous fait la transhumance au cours des 12 derniers mois?      Oui      ou      Non

|   |  |
|---|--|
| 1- Quand au cours de l'année (saison)?  |  |
| 2 - Lieu                                |  |
| 3- Durée                                |  |
| 4- Distance                             |  |
| 5- Proportion d'animaux                 |  |
| 6- Qui décide du lieu de transhumance ? |  |

## 3.4- Quelle est la source d'eau par importance?

|                | Ordonner<br>par<br>importance | Pendant<br>quelle saison | Distance moyenne<br>aux points d'eau<br>pendant la saison<br>sèche? | Distance moyenne aux points<br>d'eau pendant la saison<br>pluvieuse? |
|----------------|-------------------------------|--------------------------|---|--|
| Barrage        |                               |                          |   |  |
| Puits / forage |                               |                          |   |  |
| Marre/Puisard  |                               |                          |   |  |
| Cours d'eau    |                               |                          |   |  |
| Autres         |                               |                          |   |  |

**4- Connaissance de la trypanosomose animale**

4.1- Au cours des 12 derniers mois aviez-vous eu des bovins malades?

Oui      ou      Non

## 4.2- Quel genre de problème aviez-vous eu sur les bovins ?

|                     | Réponse | Ordre |                    | Réponse | Importance |
|---------------------|---------|-------|--------------------|---------|------------|
| Diarrhée            |         |       | Constipation       |         |            |
| Toux / poumons      |         |       | Larmoiement        |         |            |
| Plaies              |         |       | Signes nerveux     |         |            |
| Boutons sur la peau |         |       | Abcès              |         |            |
| Vers intestinaux    |         |       | Boiterie           |         |            |
| Tiques              |         |       | Faiblesse          |         |            |
| Trypanosomose       |         |       | Autres - specifiez |         |            |
| Avortement          |         |       |                    |         |            |
| Fièvre aphthuse     |         |       |                    |         |            |

4.3- Au cours des 12 derniers mois aviez-vous eu des bovins malades avec la trypanosomose?

|                          |  |
|--------------------------|--|
| Combien étaient malades? |  |
| Combien étaient morts?   |  |

4.4- Parmi ces signes quels sont les signes de la trypanosomose?

|                     |  |                  |  |
|---------------------|--|------------------|--|
| Larmoiement         |  | Diarrhée         |  |
| Boutons sur la peau |  | Ganglions élargi |  |
| Constipation        |  | Mange la terre   |  |
| Avortement          |  | Faire des ronds  |  |
| Bouche Blanchâtre   |  | Urine Rouge      |  |

4.5- Comment un animal peut tomber malade de la trypanosomose?

|                          | Réponse | Importance |                                   | Réponse | Importance |
|--------------------------|---------|------------|-----------------------------------|---------|------------|
| Mouches tsé-tsé          |         |            | A partir d'autres animaux malades |         |            |
| Autres mouches           |         |            | Autres - specifiez                |         |            |
| Tiques                   |         |            |                                   |         |            |
| A partir de l'eau        |         |            |                                   |         |            |
| Insuffisance alimentaire |         |            |                                   |         |            |
| Sortilège                |         |            |                                   |         |            |

4.6- Supposons qu'un animal est atteint de la trypanosomose

|   |              |                  |
|---|--------------|------------------|
| L'animal peut être guéri sans traitement ?              | Oui          | Non              |
| Si Oui combien d'animaux sur 10 peuvent être guéri?     | Saison sèche | Saison pluvieuse |
| Est-ce que l'animal peut à nouveau attraper la maladie? | Oui          | Non              |
| Si oui après combien de temps (en moyenne)              |              |                  |

4.7- Si vous n'aviez pas de l'argent pour traiter tous les animaux malades, quelle catégorie d'animaux traiteriez-vous par préférence? Citez par importance

| Catégories d'animaux     | Importance |
|--------------------------|------------|
| Veaux et velles < à 1 an |            |
| Jeunes mâles & femelles  |            |
| Vaches                   |            |
| Vaches en lactation      |            |
| Bœufs de labour          |            |

4.8- Qu'est-ce que vous aviez fait la dernière fois lorsqu'un animal est tombé malade de la trypanosomose?

|                       | Réponse | Importance | Autres (nommées) | Importance |
|-----------------------|---------|------------|------------------|------------|
| Demander des conseils |         |            |                  |            |
| Traiter soi-même      |         |            |                  |            |
| Rien fait             |         |            |                  |            |
| Tuer l'animal         |         |            |                  |            |
| Vendre l'animal       |         |            |                  |            |

S'il a demandé conseils, spécifier la personne chez qui il a demandé conseils:

4.9- Est-ce que l'animal a été traité avec un médicament? Si oui lequel?

4.10- Connaissez-vous autres médicaments (moderne ou traditionnel) pour guérir cette maladie?

Oui      ou      Non      Si Oui citez-les

|                      | Connais | Déjà utilisé | Plus efficace |
|----------------------|---------|--------------|---------------|
| DIM                  |         |              |               |
| ISMM                 |         |              |               |
| Comprime vert        |         |              |               |
| Tetracycline gellule |         |              |               |
| Oxy injections       |         |              |               |
