

Major Aspects of the Chronostratigraphy
and
Geologic Evolutionary History of Mars

Dissertation zur Erlangung des Grades
eines Doktors der Naturwissenschaften

vorgelegt
von
Dipl.–Geophys. Stephanie C. Werner
aus
Würzburg

am Fachbereich Geowissenschaften
der Freien Universität Berlin
Berlin, 2005

Referent: Prof. Dr. G. Neukum
Korreferent: Prof. Dr. P. Janle
Tag der Disputation: 16.12.2005

Preface and Acknowledgement

This work has been performed within the scope of the German Research Foundation's Priority Program *Mars and the Terrestrial Planets* (Schwerpunktprogramm *Mars und die terrestrischen Planeten* der Deutschen Forschungsgemeinschaft, DFG SPP 1115) as part of the project *Chronostratigraphy of Mars* at the Freie Universität Berlin, Institute of Geological Sciences.

For understanding the evolution of planets, other than Earth, remote sensing data are essential. Here, imagery acquired during many missions to Mars were used. The American missions Viking, Mars Global Surveyor, Mars Odyssey, and especially the European mission Mars Express allowed these investigations. The author appreciates the outstanding work of experiment and instrument teams, especially those of the High Resolution Stereo Camera (HRSC) onboard Mars Express.

First and foremost I would like to gratefully acknowledge the enthusiastic supervision by Prof. Dr. Gerhard Neukum. Without the numerous scientific discussions with him, his provision of resources and from time to time offering direction, this thesis would not have been possible.

I would like to thank Prof. Dr. Peter Janle who initially opened my mind to planetary science, introduced me to a number of scientific problems and has been accompanying my scientific life as a friendly mentor, and who also kindly agreed to reviewing this thesis.

Within the project "Chronostratigraphy of Mars" I have had the opportunity to more closely work with two persons I have admired since I started understanding a little more about planets. Both influenced my thinking in a most fruitful way and some aspects of this thesis would not have been discussed without their inspiration. I thank Prof. Dr. Boris A. Ivanov and Prof. Dr. Alexander T. Basilevsky

for their friendship and scientific advice. They also taught me kindness and cordiality always to be part of scientific collaboration.

Ursula Wolf not only provided technical support, patiently counting countless (innumerable) craters, but also listened and advised me in calmness and not to forget the aim of this work. Thank you very much!

This work also benefited from enthusiastic discussion within the HRSC Science Team and fruitful collaborations with Prof. Dr. Ronald Greeley, Dr. David Williams, Prof. Dr. James Head, III., Prof. Dr. Harald Hiesinger, Prof. Dr. John Murray, Prof. Dr. Bernhard Foring, Dr. Tanja Zegers, Prof. Dr. Peter Kronberg, Dr. Kenneth Tanaka. To share my results with my international colleagues I appreciate the permission to write in English, and thank Andrew Thorpe, Prof. Dr. Trond Torsvik, and Prof. Dr. Gerhard Neukum for "polishing" the English.

The members of the planetology groups at the Freie Universität Berlin and DLR-Berlin, with whom I could not only discuss science but who also made life enjoyable should not be forgotten: Stephan van Gasselt, Roland Wagner, Ernst Hauber, Harald Hoffmann, Wilhelm Zuschneid. Many interesting scientific discussion started having a cup of coffee with Dr. Ljuba Moroz, Dr. Anders Erikson and Kerstin Seller, Dr.-Ing. Olaf Lotter, Dr. Jörg Ebbing and Melanie Mesli, Dr. Jörg Knollenberg, Dr. Susanne Wölz and many others.

My parents Barbara and Priv.-Doz. Dr. Peter-Christian Werner, who always supported me to do it my way, I thank them with all my heart. And last but not least my thanks go to Prof. Dr. Trond H. Torsvik, who is backing all my enthusiasm in life and science.
