

ACKNOWLEDGEMENTS

FIRST OF ALL, I like to thank Prof. Dr. Dietmar Todt for suggesting the topic of my thesis and for his persisting interest in its progress. His friendly advice and critical commenting during the different stages of my research were extremely welcome.

Roger Mundry helped me solving statistical problems and supplied me with a new computer program, developed for this purpose. Henrik Brumm provided access to some precious equipment and kept it running. Many thanks for this support! An additional ‘thank you’ goes to all colleagues in the Behavioural Biology Group for many little favours and some nice chats, now and then, which made a pleasant working atmosphere.

Nadine Möller, Ariane Lorenz, Nora Ferge, Tina Sommer, Felix Dreher and Tini Koch assisted me in the performance of experiments, and Wiebke, Maike, Jürgen, Phillip and Sarah were such wonderful helpers in collecting valuable self-report data. The Kapernaum-Kindergarten in Berlin-Wedding and the Lauser-Kindergarten in Berlin-Wilmersdorf allowed me to whisper with their kids. In all these cases, I appreciated the valuable assistance very much.

I am grateful to Tina Adam for trying to get a good shot of whispering kids, (no easy job!) and also Ariane Lorenz for encouraging me during my work. They always lend me an ear or shoulder if I needed one. Additionally warm thanks to Hauke Studier for so often addressing me by a whispering voice. He helped me a lot with the wording and the layout of the manuscript.
