

THE ROLE OF PLASMACYTOID DENDRITIC CELLS
IN IMMUNE RESPONSES TO INFLUENZA VIRUS INFECTION

Inaugural Dissertation
to obtain the academic degree

Doctor rerum naturalium
(Dr. rer. nat.)

Submitted to the Department of Biology, Chemistry and Pharmacy,
Freie Universität Berlin

by
Amaya Iparraguirre Heydemann

Berlin, January 2007

Completed at the Wistar Institute, Philadelphia in the group of Prof. Dr.
Wolfgang Weninger

1. Supervisor: Prof. Dr. Wolfgang Weninger

The Wistar Institute and Departments of Dermatology and Pathology
Laboratory Medicine, University of Pennsylvania

2. Supervisor: Prof. Dr. Gerd Multhaup

Institute for Biochemistry, Department of Biology, Chemistry and
Pharmacy, Freie Universität Berlin

Date of the Defense: 20.3.2007

I would like to dedicate this work to my sister
Isabel Iparraguirre

ACKNOWLEDGEMENTS

I would like to express my gratitude to my supervisor, Prof. Dr. Wolfgang Weninger for giving me the opportunity to continue working with him after my Diploma. I thank him for introducing me to this intriguing and challenging project that gave me a great opportunity to learn new skills. Under his supervision, I was able to continually broaden my knowledge of the immune network and to learn new techniques. Dr. Weninger guided my experimental work and greatly supported my ideas for new and interesting experiments and he had continuous time and patience during the discussion of the results and their meaning. I especially thank Dr. Weninger for critical reading of my thesis, his tremendous efforts to this work and to improve my writing skills. I am truly grateful for the positive impact of our scientific relationship on my career.

I am very thankful to Prof. Dr. Gerd Multhaup at the FU in Berlin, who kindly agreed to take the position of a second supervisor of my work. Furthermore, I would like to thank Prof. Dr. Ferdinand Hucho, who was among the first supporters in my motivation for scientific research during my biochemistry studies at the FU in Berlin. I am very grateful that Prof. Dr. Hucho agreed to review my thesis.

I wish to thank Prof. Dr. von Andrian at the CBR in Boston for giving me the opportunity in the past to complete my diploma thesis project in his laboratory. My work in Dr. von Andrian's laboratory provided the foundation for my work with Dr. Weninger. I thank Dr. von Andrian for his generosity to use the transgenic mice that were generated in his laboratory and without which this study would have not been possible. I would like to thank Dr. Cornelia Halin for her contributions to Figure 27.

I would especially like to thank all members of the Weninger lab and all my colleagues in the Wistar Institute for their helpful advices and contributions to my work. From Dr. Lois Cavanagh, I learned my first background of dendritic cells. Lois was very forthcoming with

technical advice and suggestions for further experiments as well as helpful discussions. Major technical assistance was provided by Dawn McKissic, who tremendously helped with preparations of viral stocks and their purifications and the set up for the micro array experiments. She also contributed to the maintenance of my mouse colony. I would like to also thank Drs. Lai Guan Ng and Christoph Höller. They were fun and contributed to a supportive and motivating atmosphere in the lab. I would also like to mention Dr. Paulus Mrass, who bestowed us all with some unforgettable moments in the lab. Norma, Dan and Mohammed were indispensable in stocking the lab with supplies and helped to keep the mice and the lab in order.

Many other people from adjacent labs were helpful along the way and provided mice, reagents and fruitful discussions. First of all, thanks to the people in the Flow Cytometry department, Jeffrey Faust, Lester Acosta and Matt Farabaugh, for sorting millions of pDCs, for making time available on the FACS machines and for endless support and entertainment during long hours running samples. Thanks to all collaborators at the Wistar Institute, who generously shared their knowledge, mice and reagents, especially Dr. Andrew Caton, Dr. Walter Gerhard, Dr. Jan Erikson, Dr. Hildegund Ertl and Dr. John E. Wherry. Special thanks to all members of these labs. Thanks also to members outside of the Wistar Institute at the University of Pennsylvania that I had the pleasure to work with: Dr. Christopher A. Hunter, who provided important input into signaling experiments in the first chapter and Dr. David Allman, who provided the pDC-deficient Ikaros^{L/L} mice used for experiments in the third chapter of this thesis.

My special thanks and unlimited gratitude is addressed to my family, my mother Sigrid Heydemann and my father Javier Iparraguirre. They gave me constant support during my studies and my work. Without them, I would probably never have achieved my goals. I would especially like to mention my sister, Isabel Iparraguirre, who has cystic fibrosis. It is because of her condition, that I became interested in biochemistry and medicine from early on. She is a constant motivation for me. I would also especially like to thank my beloved John for enduring my frustration and for giving me endless encouragement on my way to

becoming a scientist. He has shared with me the most important moments in my life, he taught me patience in my work, and supported me tremendously while I was writing my thesis. Thank you.
