

## ACKNOWLEDGEMENT

This dissertation was conducted within the project “The Psychology of Sehnsucht (Life Longings)” at the Center for Lifespan Psychology at the Max Planck Institute for Human Development. While working on my dissertation, I was a member of the International Max Planck Research School “The Life Course: Evolutionary and Ontogenetic Dynamics (LIFE)”. I was financially supported by a pre-doctoral stipend from the Max Planck Society.

Foremost, I wish to express my deepest gratitude to the late Prof. Paul B. Baltes for giving me the opportunity to work in the excellent and stimulating academic environment of the Max Planck Institute, for sharing his incomparably profound knowledge with me, for deepening my understanding of lifespan psychology and science, and for always challenging me. After each meeting with him I felt a little “wiser”.

I am very grateful to Prof. Ulman Lindenberger and Prof. Fredda Blanchard-Fields for taking over the supervision of my dissertation after the death of Paul B. Baltes. In particular, I thank Ulman Lindenberger for his helpful advice concerning methods and statistical analyses. I am very grateful to Fredda Blanchard-Fields for devoting so much time, energy, and above all, commitment to mentoring me. Thank you, Fredda, for all your encouraging words and for supporting me. A very special thanks goes to Dr. Susanne Scheibe for her excellent advice, her patience and friendliness, and the professionalism with which she “informally” supervised my dissertation.

I thank my colleagues at the Center for Lifespan Psychology for fruitful discussions about my dissertation study and for creating such a nice work atmosphere. I would like to emphasize those who went through the ups and downs of writing a dissertation with me: my doctoral colleagues, particularly Anna Kleinspehn, Antje Rauters, Annette Brose, Christina Röcke, and Yee Lee Shing. I could always rely on their support. I thank our student research assistants (Maja Wiest, Anna Ludwig, Peter Zurek, Christine Ortbandt) and interns (Corinna Fink, Nicole Haag) for their help during all phases of my work. Special thanks go to Dr. Julia Delius for improving the English version of my thesis and to Ruth Theobald and Amy Michéle for their help in translating questionnaire items. Thanks also to Helga Kaiser, Anke Schepers, Helena Maravilla, Penny Motley, and Werner Scholtysik.

Being part of the Max Planck Research School LIFE was a very special and invaluable experience for me. I thank all fellows, especially those of the third cohort, and all faculty members, particularly Prof. Jacqui Smith, Prof. Abigail Stewart, and Prof. Toni Antonucci for their helpful feedback concerning my presentations and/or my dissertation proposal.

This work would not have been possible without the unconditional support of my family and friends. A special thanks to my parents, to Anja, Jirka, and GG, to my grandmothers, and to Hermine.

Finally, I want to thank the person who supported me more than anyone else - my husband Daniel Grünh. Whenever I had questions that I did not dare ask someone else, I could ask him. Thank you so much for discussing these and many other questions with me at all possible and impossible times, for being so patient und self-sacrificing, and for always giving me strength and hope.
