

## 8 ACKNOWLEDGEMENTS

This work was conducted at the Robert Koch-Institute, Berlin, at the department Viral Infections (FG12) during the years 2000-2005 under the supervision of Professor Dr. Hartmut Hengel. Working in Hartmuts researchgroup, the time was not only enjoyable, but also highly educational. Hartmut, I wish to express my gratitude for your excellent guidance in scientific thinking and for you instructive and authentic leadership.

I am deeply thankful to our collaborators Dr. Frank Momburg, DKFZ, Heidelberg and Dr. Peter van Endert, Hopital Necker, Paris, whose support has been inalienable. Our discussions concerning TAP structure and function have been fascinating and highly motivating for me. I also wish to thank Frank for giving me the opportunity to work in his lab and learn how to perform the peptide translocation assay.

At this point I like to express my gratitude to Dr. Albert Zimmermann. His expertise in the lab and participation in scientific discussions have been very important and profitable for my thesis. Besides of that Albert, it was a blast working in the lab with you!

I wish to acknowledge professor Dr. Rupert Mutzel for his readiness to supervise my thesis at the Freie Universität Berlin.

I have been very fortunate of having the support of Dr. Annabel Tischer and Anne Wolbert. Annes assistance during my pregnancy was not only technically important, but also meant a lot to me on a personal level. Thank you!

Huge thanks goes to all my colleagues, past and present members of the CMV-group. You have been much more than just colleagues to me, holding the spirit high in both bad times and good times. To Henrike Reinhard, Jan Stindt and Arndt Bigl, beginning as students in the lab working with me, special thanks for helping me with cloning and construction of recVac's.

The co-authors, Mario Lobigs, Canberra, Australia, Dagmar Bauer, Düsseldorf and Loredana Saveanu, Paris, France, owe my gratitude, as well as Danijela Koppers-Lalic, Leiden, Netherlands, for inspiring discussions. I also wish to thank Anke Lüske for her technical advice concerning the construction of recombinant vaccinia viruses.

To the residents of the postdoc room, Tim Finsterbush and Matthias Budt: thank you for good advice in all sorts of things, good company and last but not least, for patient reading of my thesis!

I am thankful to the whole department Viral Infections (FG12). It has been a friendly environment to work in and the will to help each other was always present. My thanks also go

to Stefan Biere for computational assistance and for helping me to complete the thesis document.

I warmly wish to thank my dear friend Gunhild Unterstab. Thank you for being who you are and especially for bearing up with me! I also want to thank all my friends in Finland for whom the distance to Berlin was never too far.

I am deeply grateful to my family for always supporting me, always.

My last thanks goes to the person who has been most present throughout my PhD. Thank you Tobias for your everlasting support, for giving me the courage to resist drawbacks and for all the good times.
