The Structure of Cognitive Abilities in Old and Very Old Age

On the Importance of Specific Group Factors in a Dedifferentiated Factor Space

Florian Schmiedek

Dissertationsschrift zur Erlangung des Doktorgrades der Philosophie am Fachbereich Erziehungswissenschaft und Psychologie der Freien Universität Berlin

Berlin 2002
Disputation: 6. Februar 2003

Gutachter:
Prof. Dr. Paul B. Baltes
Prof. Dr. Ralf Schwarzer

Abstract 11
Zusammenfassung 13

1. THEORETICAL BACKGROUND 27

1.1 Overview 27
1.2 Theories of Cognitive Aging 28
1.2.1 Information-Processing Approaches 28
1.2.1.1 Processing Speed 28
1.2.1.2 Working Memory and Executive Functions 29
1.2.2 Psychometric Approaches 30
1.3 The Structure of Human Cognitive Abilities 34
1.3.1 Hierarchical Models of Intelligence: A Static View on the Structure of Cognitive Abilities 34
1.3.2 Hierarchical Models of Information-Processing Constructs 37
1.4 Dynamic Perspectives on the Structure of Cognitive Abilities 39
1.4.1 Developmental Differences of the Cognitive and Sensorimotor Factor Structures 40
1.4.1.1 Dedifferentiation Hypothesis 40
1.4.1.2 Common Cause Hypothesis 42
1.4.2 Lifespan Developmental Antecedents, Correlates, and Consequences of Cognitive Abilities 43
1.4.2.1 Antecedents 43
1.4.2.2 Correlates 45
1.4.2.3 Consequences 45
1.4.3 The Logical Status of Common Factors 46
1.5 Methodological and Design Issues of Cognitive Aging Research 48
1.5.1 Cross-Sectional Designs 49
1.5.1.1 Extreme Age-Group Studies 49
1.5.1.2 Correlational Studies 51
1.5.2 Longitudinal Designs 52
1.6 Recent Debates About Multivariate Models of Cognitive Aging 55
1.6.1 Salthouse and Czaja (2000) Models 55
1.6.2 Statement of Problem 57
1.6.3 Methodological Excursion: A Critique of Stepwise Procedures 57
1.7 The Nested Factor Model: An Alternative Representation 59
1.7.1 The Role of the Age Variable 64
1.7.1.1 Chronological Age as a Predictor Variable 65

1.7.1.2 Chronological Age as a Covariate or as a Dependent Variable ... 66
1.8 Summary of Theoretical Part ... 69

2. EMPIRICAL INVESTIGATIONS ... 71

2.1 Overview ... 71
2.1.1 About the Berlin Aging Study ... 71
2.1.1.1 Previous Analyses of BASE Cognitive Ability Data With Hierarchical Models ... 72
2.1.2 Motivations for the Selection of External Criterion Variables ... 73
2.1.2.1 Education and Socioeconomic Status ... 73
2.1.2.2 Personality Factors ... 74
2.1.2.3 Sensory and Sensorimotor Functioning ... 75
2.1.2.4 Everyday Activities ... 76
2.2 Research Hypotheses ... 77
2.3 Method ... 78
2.3.1 Sample ... 78
2.3.2 Cognitive Tasks ... 78
2.3.3 External Criterion Variables ... 79
2.3.3.1 Socioeconomic Status ... 79
2.3.3.2 Openness for Experience ... 79
2.3.3.3 Activity Competence and Engagement ... 79
2.3.3.4 Sensory and Motor Performance Indicators ... 80
2.3.4 Analyses and Structural Equation Models ... 80
2.3.4.1 Overview of Analyses ... 80
2.3.4.2 Structural Equation Models ... 81
2.4 Results ... 82
2.4.1 Measurement Model With the Nested Factor Structure ... 82
2.4.2 Age Differences in the Factor Structure ... 84
2.4.3 General and Specific Age Relations of the Nested Factor Structure ... 86
2.4.3.1 Age-as-a-Predictor Model ... 86
2.4.3.2 Age-as-a-Covariate Model ... 86
2.4.3.3 Age as a Dependent Variable ... 88
2.4.3.4 Comparison With Oblique Factor Model ... 89
2.4.4 Summary of Nested Factor Models and Their Relations to Age ... 90
2.4.5 Relations of General and Specific Factors to External Criterion Variables ... 91
2.4.5.1 Socioeconomic Status and Education ... 91
2.4.5.2 Openness for Experience ... 92
2.4.5.3 Sensory and Sensorimotor Functioning ... 93
2.4.5.4 Basic and Expanded Activities ... 94
2.4.6 Summary of Analyses of External Criterion Variables ... 95
2.4.7 Control Analyses ... 96
2.4.7.1 Potential Influence of Imputed Missing Values ... 97
2.4.7.2 Multivariate Normality Assumption of SEM Models ... 98

2.4.7.3 Sensitivity Analysis of the Estimates of General and Specific Age-Associated Effects 99
2.5 Monte Carlo Simulation Study 101
2.5.1 Study Design and Method 101
2.5.2 Results 104
2.5.2.1 Heywood Cases and Improper Solutions 104
2.5.2.2 Standard Errors of the Effect Estimates 104
2.5.2.3 Sensitivity of Model Fit to Omission of Specific Effects 105
2.5.3 Summary of Monte Carlo Study Results 106

3. GENERAL DISCUSSION 108

3.1 Overview 108
3.2 Multidimensionality of Cognitive Abilities in Old and Very Old Age 108
3.3 Multidirectionality of Age-Associated Differences 109
3.3.1 Assumptions About the Age-Independent Structure in the Nested Factor Model 110
3.3.2 Age as a Correlate or Dependent Variable 111
3.4 Interpretation of General and Specific Factors and Their Age Relations 112
3.4.1 Information-Processing Components of the Cognitive Tasks 113
3.4.2 Processing Speed as a Mediating Construct 113
3.4.3 The Interplay of the Cognitive Mechanics and Pragmatics 114
3.5 Antecedents, Correlates, and Consequences of the Cognitive Factors 116
3.5.1 Education and Openness to Experience 116
3.5.2 Everyday Cognitive Competency 117
3.5.3 Broad Versus Narrow Criterion Variables 118
3.5.4 Nested Factor Models of Cognitive and Sensorimotor Variables 119
3.6 Technical Issues and Monte Carlo Study 120
3.6.1 Estimation Problems 121
3.6.2 Disproportionality of General and Specific Variance in the Indicator Variables 122
3.7 Future Directions 123
3.8 Conclusions 124

5. APPENDICES 145

5.1 Appendix A. Simulations Illustrating Biases in Estimating General and Specific Effects Using Stepwise Procedures 145
5.1.1 Salthouse (1998) and Allen et al. (2001) Procedure 145
5.1.2 Christensen et al. (2001) Procedure 147
5.2 Appendix B. Examining the Parameter Dynamics of the Nested Factor Model 149
5.2.1 Simulation Example of the Nested Factor Model 150
5.2.2 Simulation Example With Empirical Proportionality of General and Specific Factor Loadings 151

5.2.3 Simulation Examples With Varying Degrees of Heterogeneity of the General to Specific Variance Ratio 151
5.2.4 Simulation Example With Age as a Correlate 152
5.3 Appendix C. Equivalence between Nested Factor Loading Matrix based on Age-Partialled Covariance Matrix and Nested Factor Loading Matrix of a Model Specifying Age-Associated Effects on All Factors 154
5.4 Appendix D. Activities Coded in the Yesterday Interview and Their Correlations With Cognitive Ability Tasks 156
5.5 Appendix E. Standardized Factor Loadings of the Nested Factor Model Estimated Separately for two Age Groups of the BASE Sample and for a Younger Adult Sample 158
5.6 Appendix F. Comparison of Unstandardized Factor Loadings in Age-as-a-Predictor Model, Age-as-a-Covariate Model, and in Age-Partialled Model 161
5.7 Appendix G. Age-Partialled Correlations of General and Specific Factors in the Nested Factor Model With Indicators and a Latent Factor of Socioeconomic Status 163
5.8 Appendix H. Age-Partialled Correlations of General and Specific Factors in the Age-as-a-Predictor Model With Items and Scale Scores of Openness for Experience From the NEO 164
5.9 Appendix J. Standardized Factor Loadings of the Nested Factor Model Estimated for Tasks Without Imputed Missing Values (N = 416) and With Missing Values Imputed by EM-Algorithm 165
5.10 Appendix K. Bootstrap Results for the Nested Factor Model With Age Correlations of the General and Specific Factors 167
5.11 Appendix L. Bootstrap Results for the Nested Factor Model Predicting Writing Activity 169
5.12 Appendix M. SAS Program Code of the Monte Carlo Simulation Study 170
5.13 Appendix N. Influence of Sample Size and Number of Indicator Variables on the Number of Heywood Cases and Improper Solutions 178
5.14 Appendix O. Main Effects and Interactions of Factors Examined in the Monte Carlo Study on Standard Errors of the Estimates of General and Specific Age-Associated Effects 179
5.15 Appendix P. Bias in Estimates of General and Specific Age-Associated Effects and Distribution of General Effect Estimates 181
