### **Acknowledgements**

There are many people who supported me on my journey leading to this work, and I would like to express my sincere gratitude to all of them, especially to those whom I cannot mention explicitly in the following. I am quite aware that I wouldn't have reached this point without them and I hope that I can return this help – to them or to other people who need it.

First of all, I would like to thank my supervisor, Professor Dr. Klaus Christmann, for attracting me, when I was about to become a theoretician, to the respectable trade of experimental surface science, for the vivid, open-minded atmosphere in his group, and, among many other things, for his continuous readiness for discussion.

Among my colleagues (and former colleagues) in the Christmann group, I am especially indebted to Dr. Klaus Schmidt, who was my mentor in the practical surface science work. His technical improvements on my UHV chamber are still a great help, and I can hardly imagine working at a synchrotron again without Klaus.

I thank Dr. Pia Katharina Schmidt for being the perfect neighbour. We shared a lot of things: screwdrivers, jelly bears, ideas ...

I will certainly miss Christian Pauls and the rare combination of encyclopaedic knowledge and the ability to pass it on. I learned a lot from him and hope, he can realize some of his many brilliant ideas on surface science.

Rudolf Cames was indispensable during our BESSY-I and II beam times. He embellished my academic life with flowers ("season-indicator") and continuously enhanced the value of my students ID card. Thanks for all, Rudi!

I thank my (former) colleagues Astrid Heiland, Astrid Weingart, Dirk Rosenthal, Elizabeth Willneff, Karifala Dumbuya, Karin Schubert, Dr. Norbert Weiher, Dr. Ronald Wagner, and Dr. Sven Schröder for the stimulating and creative atmosphere in our group and for the numerous discussions. I wish them patience, luck, and success with their own experiments.

Nadia Elghobashi did brilliant research on oxygen-ion sputtering, was a perfect co-author, and patiently corrected the English of our papers.

I thank my research trainees Jenny Fischer, Andrea Karrasch, Stefan Böing, and Bernd Lübecke for their excellent work.

I frequently bothered the workshops for electronics and mechanics with my technical problems – sorry and thanks to Peter Schwarze, Heinrich Gattner, Helgo Hesse, and Horst Binkowski.

The BESSY staff, especially Dr. Torsten Kachel, Heiko Gundlach, Dr. Ingo Packe, and Dr. Olaf Schwarzkopf always took care to solve technical problems instantly and to maximize our rare synchrotron beam time.

## Acknowledgements

I would like to thank Prof. Dr. H. Baumgärtel, Prof. Dr. K. Christmann, Prof. Dr. D. Haase, Prof. Dr. K. Krischer, Dr. Sven Schröder, and Prof. Dr. K.-M. Weitzel for the productive collaboration on several Physical Chemistry courses, which always earned high marks in the student evaluation. And I thank all my students for their concentrated and active participation in our seminars.

I thankfully remember some of my teachers, especially Mrs Reißmann (Dresden-Plauen) who represented the dignity of science in a unique, inimitable manner.

I am deeply indebted to Prof. em. Dr. Hermann Scheler, TU Dresden, for patiently accompanying my first steps to chemistry some twenty years ago. It was not his fault that he could never reap what he had sown, nor was it mine.

I have to thank my parents in many respects, but in this context especially for supporting all my various and frequently changing interests. And I thank my father, a chemist himself, for strengthening my wish to study chemistry by permanently suggesting other subjects.

I thank Kirsten and Wendla Johanna Schaper.
