

**Electron Confinement  
in Thin Metal Films:  
Structure, Morphology and Interactions**

im Fachbereich Physik  
der Freien Universität Berlin  
eingereichte Dissertation

vorgelegt von  
**Jan Hugo Dil**  
aus  
Amersfoort, The Netherlands

Mai 2006

1. Gutachter: Prof. Karsten Horn, Ph.D.
2. Gutachter: Prof. Dr. Paul Fumagalli

Datum der Disputation: 12. Juli 2006

# Contents

1. Background and theory	1
1.1. Towards quantum size effects	1
1.2. Quantum well states: “textbook physics in the lab”	3
1.3. Electronic growth model and self-organized growth	9
1.4. Influence of the substrate and interface	14
2. Experimental	17
2.1. Technology	17
2.1.1. Ultra high vacuum equipment	17
2.1.2. Angle Resolved Photoemission Spectroscopy	19
2.1.3. The Omicron AR65 and Specs Phoibos 100 CCD electron energy analysers	23
2.1.4. Alignment of Sample, Analyser and Light	28
2.1.5. Synchrotron Radiation	30
2.2. Sample preparation	31
2.2.1. Preparation and cleaning of the substrates	31
2.2.2. Preparation of the metal overlayers	34
3. Two way influence of the atomic and electronic structure	37
3.1. Influence of the atomic on the electronic structure: The formation of Quantum Well States	37
3.1.1. Quantum Well States in thin Pb films	37
3.1.2. Quantum Well States in thin In films	50
3.1.3. Quantum Well States in thin Al films	57
3.2. Influence of the electronic on the atomic structure: Electronic growth	62
4. Substrate and interface effects	71
4.1. The influence of lattice mismatch and relaxation on QWS	71
4.2. Influence of the interface atomic structure and the substrate bandgap	78
4.3. Coupling of quantum wells: Pb/Al/Si(111)	84
4.4. Hybridization of QWS with substrate bands	89
5. Quantum Well States beyond the single particle model	95
5.1. Electron localization and correlation effects in Pb/Si(111)	98
5.2. Electron-phonon coupling: In on Si(111)	106
6. Summary	115
Bibliography	117
